## RP120Q-RW

**120 Watt  
Quarter  
Brick  
Single Output**

### Description

The quarter-brick RP120Q series DC/DC converters are designed for railway rolling stock and high voltage battery applications. Each series has three 4:1 input voltage range options to cover all input voltages from 9VDC up to 160VDC with isolated and regulated 5V to 48VDC outputs. The converters have high efficiencies and metal base-plates to permit a wide operating temperature range from -40°C to +85°C (when mounted on a suitable heatsink). The case is fitted with threaded inserts to allow secure mounting to the PCB or bulkhead for use in high shock and vibration environments. The converters are EN50155 and IEC/EN60950 certified. The RP120Q-RW series have a three year warranty.

## OUTPUT TRIM

### Output Voltage Trimming

RP120Q-RW converters offer the feature of trimming the output voltage over a certain range around the nominal value by using external trim resistors. The values for trim resistors shown in trim tables below are according to standard E96 values; therefore, the specified voltage may slightly vary; they also can be calculated with below shown equation.

Specifications (measured @ ta= 25°C, nominal input voltage, full load and after warm-up)

### OUTPUT TRIM

#### Trim Calculation

$$R_1 = \left[ \frac{511 \cdot V_{out} + 5.11 \Delta V_{out} \cdot V_{out}}{1.225 \cdot \Delta V_{out}} - \frac{(511 + 10.22 \Delta V_{out})}{\Delta V_{out}} \right] k\Omega$$

Vout = Output Voltage  
 $\Delta V_{out}$  = Output Voltage Trim in %  
 R1 = trim up resistor  
 R2 = trim down resistor

$$R_2 = \left[ \frac{511}{\Delta V_{out}} - 10.22 \right] k\Omega$$

#### Practical Example:

##### Trim Up:

Vout = 5V,  $\Delta V_{out}$  = 10% (5.5V)

$$R_1 = \left[ \frac{511 \cdot V_{out} + 5.11 \Delta V_{out} \cdot V_{out}}{1.225 \cdot \Delta V_{out}} - \frac{(511 + 10.22 \Delta V_{out})}{\Delta V_{out}} \right] k\Omega = \frac{511 \cdot 5 + 5.11 \cdot 10 \cdot 5}{1.225 \cdot 10} - \frac{511 + 10.22 \cdot 10}{10} = 229.43 - 61.32 = 169 k\Omega$$

##### Trim down:

Vout = 5V,  $\Delta V_{out}$  = -10% (4.5V)

$$R_2 = \left[ \frac{511}{\Delta V_{out}} - 10.22 \right] k\Omega = \frac{511}{10} - 10.22 = 41.2 k\Omega$$

### Thermal Calculation

$$R_{th\text{case-ambient}} = 9^\circ\text{C/W (vertical)}$$

$$R_{th\text{case-ambientHC}} = 7.1^\circ\text{C/W (vertical)}$$

$$R_{th\text{case-ambient}} = \frac{T_{\text{case}} - T_{\text{ambient}}}{P_{\text{dissipation}}}$$

$$P_{\text{dissipation}} = P_{\text{IN}} - P_{\text{OUT}} = \frac{P_{\text{OUTapp}}}{\eta} - P_{\text{OUTapp}}$$

$T_{\text{case}}$  = Case Temperature

$T_{\text{ambient}}$  = Environment Temperature

$P_{\text{dissipation}}$  = Internal losses

$P_{\text{IN}}$  = Input Power

$P_{\text{OUT}}$  = Output Power

$\eta$  = Efficiency under given Operating Conditions

$R_{th\text{case-ambient}}$  = Thermal Impedance

### Practical Example:

Take the RP120Q-2405SRW with 9V input Voltage and 50% load. What is the maximum ambient operating temperature? Use converter vertical in application without airflow.

$$\text{Eff}_{\text{min}} = 91\% @ V_{\text{nom}}$$

$$P_{\text{OUT}} = 120\text{W}$$

$$P_{\text{OUTapp}} = 120 \times 0.5 = 60\text{W}$$

$$\eta = 91\% \text{ (Efficiency vs. Load Graph)}$$

$$P_{\text{dissipation}} = \frac{60}{0.91} - 60 = 5.93\text{W}$$

**without Heat-sink**

$$R_{\text{th}} = \frac{T_{\text{casemax}} - T_{\text{amb}}}{P_{\text{dissipation}}} \rightarrow 9^\circ\text{C/W} = \frac{100 - T_{\text{amb}}}{5.93\text{W}}$$

$$T_{\text{amb}} = 46^\circ\text{C}$$

**with Heat-sink**

$$R_{\text{thHC}} = \frac{T_{\text{casemax}} - T_{\text{amb}}}{P_{\text{dissipation}}} \rightarrow 7.5^\circ\text{C/W} = \frac{100 - T_{\text{amb}}}{5.93\text{W}}$$

$$T_{\text{ambHC}} = 57^\circ\text{C}$$
