### Superior Moving Resolution

#### Increased Lens Resolution

Moving resolution (error based on workpiece surface position) has been reduced dramatically by optimizing the optical system with increased sensitivity and resolution of the light receiving lenses.

Sampling: 4 ms

### Reduced Error for Different Materials

#### 2D CMOS

With a CCD, the charge overflows to the next pixel when excessive light is received. This phenomenon does not occur with CMOS, so there are no effects from light fluctuations from different materials or excessive light reception.

## Technology

With OMRON's sensing technology and newly developed algorithms, stable, high-precision measurement is possible of workpieces that were difficult to measure using laser displacement meters due to laser light penetration, transmission, excessive reflection, or insufficient light.

### Mechanisms for Stable Measurement Patent Pending

No more errors due to reflection coefficients between glass gaps

Stable measurement by adding received light waveform in 2D image and digital zoom processing.

Measurement cycle time 1/8 better than previous models with addition of received light waveform captured by 2D CMOS and simultaneous measurement of front and back glass surfaces with separate sensitivities.

### Mechanisms for Stable Measurement Patent Pending

No more errors due to workpiece reflection coefficients.

Stable measurement using laser power algorithms that can be adjusted to any value.

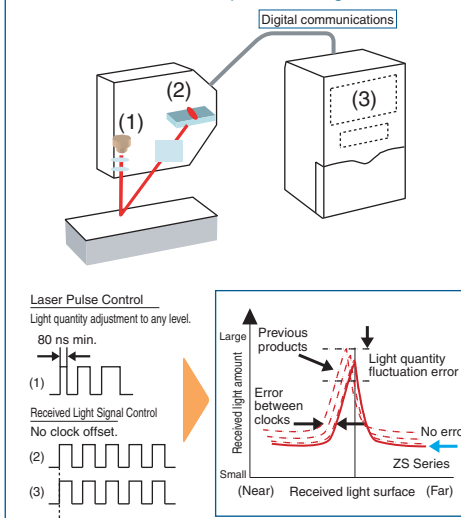

Light quantity adjustment algorithms have evolved for stable measurement of a variety of measurement objects. Even if the workpiece status changes suddenly, the sensitivity can compensate at any level so there is no measurement error from sensitivity switching.

### Mechanisms for High Resolution Patent Pending

No more resolution errors.

Digital processing technology between the Sensor and Controller provides high resolution.

High-speed digital communications (LVDS) used between Sensor and Controller. Image signal stabilizes because the clock error between the control signal from the Controller and the light reception device disappears. Optimum light quantity adjustment is possible with laser power algorithms that can be adjusted to any level, which facilitates super high resolution.

### Mechanisms for Stable Measurement

No more error due to penetration.

Stable measurements are achieved by correctly recognizing the light reception distribution on the 2D CMOS.

Real surface displacement detected by eliminating penetration effects for PCBs, plastic, and other workpieces penetrated by laser light.
