**Description**

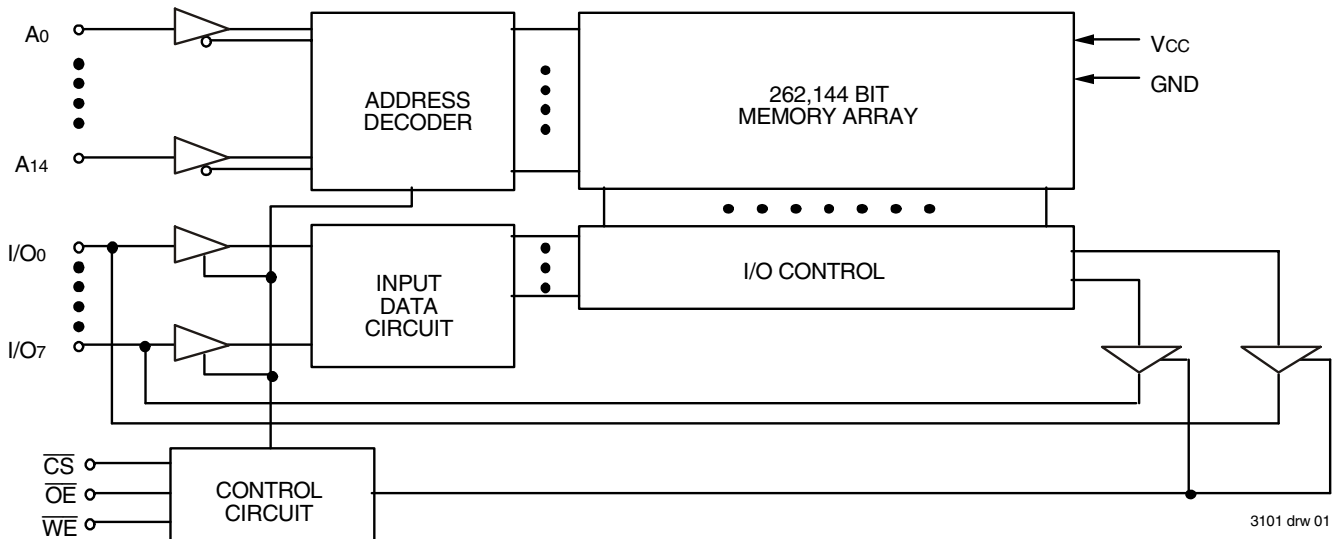

The IDT71V256SA is a 262,144-bit high-speed static RAM organized as 32K x 8. It is fabricated using a high-performance, high-reliability CMOS technology.

The IDT71V256SA has outstanding low power characteristics while at the same time maintaining very high performance. Address access times of as fast as 12ns are ideal for 3.3V secondary cache in 3.3V desktop designs.

When power management logic puts the IDT71V256SA in standby mode, its very low power characteristics contribute to extended battery life. By taking  $\overline{CS}$  HIGH, the SRAM will automatically go to a low power standby mode and will remain in standby as long as  $\overline{CS}$  remains HIGH. Furthermore, under full standby mode ( $\overline{CS}$  at CMOS level, f=0), power consumption is guaranteed to always be less than 6.6mW and typically will be much smaller.

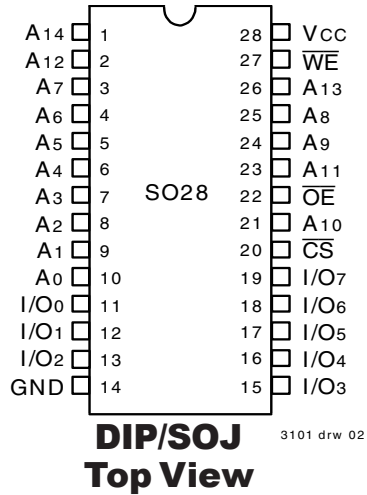

The IDT71V256SA is packaged in a 28-pin 300 mil SOJ and a 28-pin 300 mil TSOP Type I.

### Timing Waveform of Read Cycle No. 1<sup>(1)</sup>

3101 drw 06

**NOTES:**

1.  $\overline{WE}$  is HIGH for Read cycle.
2. Transition is measured  $\pm 200\text{mV}$  from steady state.

### Timing Waveform of Read Cycle No. 2<sup>(1,2,4)</sup>

3101 drw 07

### Timing Waveform of Read Cycle No. 3<sup>(1,3,4)</sup>

3101 drw 08

**NOTES:**

1.  $\overline{WE}$  is HIGH for Read cycle.
2. Device is continuously selected,  $\overline{CS}$  is LOW.
3. Address valid prior to or coincident with  $\overline{CS}$  transition LOW.
4.  $\overline{OE}$  is LOW.
5. Transition is measured  $\pm 200\text{mV}$  from steady state.

### Timing Waveform of Write Cycle No. 1 ( $\overline{WE}$ Controlled Timing)<sup>(1,2,4,6)</sup>

3101 drw 09

**NOTES:**

1. A write occurs during the overlap of a LOW  $\overline{CS}$  and a LOW  $\overline{WE}$ .
2.  $t_{WR}$  is measured from the earlier of  $\overline{CS}$  or  $\overline{WE}$  going HIGH to the end of the write cycle.
3. During this period, I/O pins are in the output state so that the input signals must not be applied.
4. If the  $\overline{CS}$  LOW transition occurs simultaneously with or after the  $\overline{WE}$  LOW transition, the outputs remain in a high-impedance state.
5. Transition is measured  $\pm 200\text{mV}$  from steady state.
6. If  $\overline{OE}$  is LOW during a  $\overline{WE}$  controlled write cycle, the write pulse width must be the larger of  $t_{WP}$  or  $(t_{WHZ} + t_{DW})$  to allow the I/O drivers to turn off and data to be placed on the bus for the required  $t_{DW}$ . If  $\overline{OE}$  is HIGH during a  $\overline{WE}$  controlled write cycle, this requirement does not apply and the write pulse can be as short as the specified  $t_{WP}$ .

### Timing Waveform of Write Cycle No. 2 ( $\overline{CS}$ Controlled Timing)<sup>(1,2,3,4)</sup>

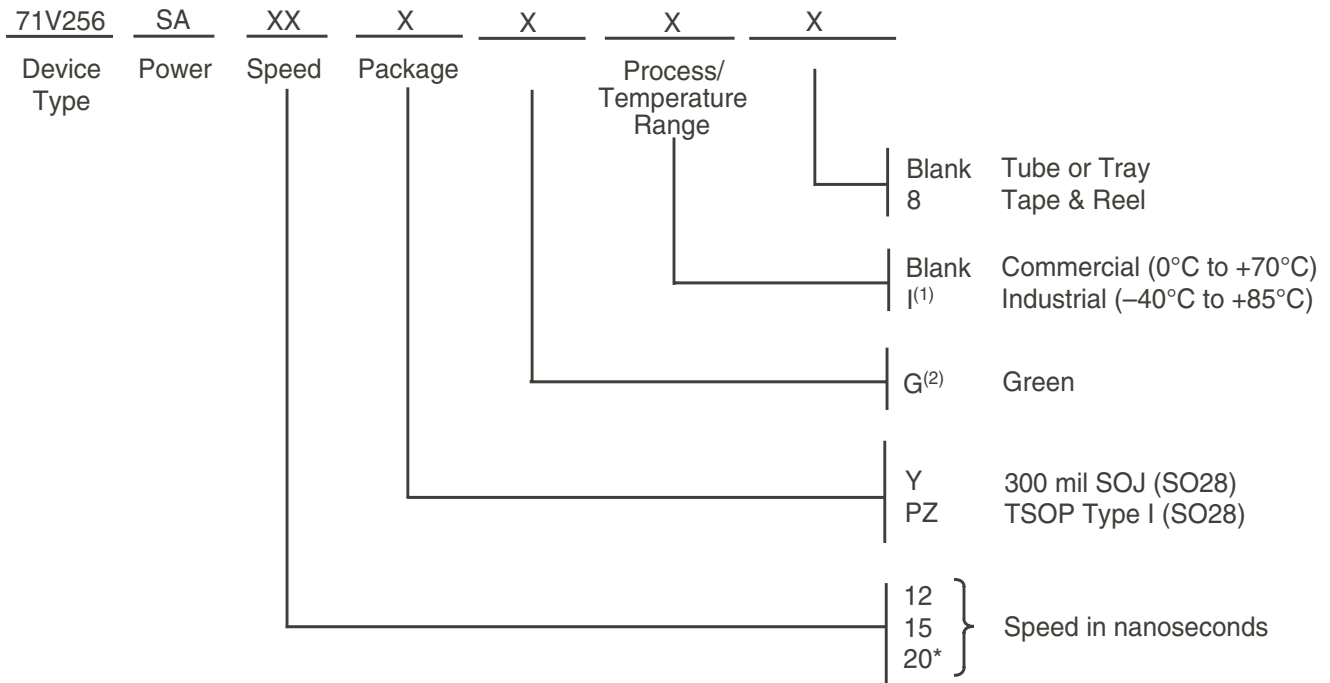

3101 drw 10

**NOTES:**

1.  $\overline{WE}$  or  $\overline{CS}$  must be HIGH during all address transitions.
2. A write occurs during the overlap of a LOW  $\overline{CS}$  and a LOW  $\overline{WE}$ .
3.  $t_{WR}$  is measured from the earlier of  $\overline{CS}$  or  $\overline{WE}$  going HIGH to the end of the write cycle.
4. If the  $\overline{CS}$  LOW transition occurs simultaneously with or after the  $\overline{WE}$  LOW transition, the outputs remain in a high-impedance state.
5. If  $\overline{OE}$  is LOW during a  $\overline{WE}$  controlled write cycle, the write pulse width must be the larger of  $t_{WP}$  or  $(t_{WHZ} + t_{DW})$  to allow the I/O drivers to turn off and data to be placed on the bus for the required  $t_{DW}$ . If  $\overline{OE}$  is HIGH during a  $\overline{WE}$  controlled write cycle, this requirement does not apply and the write pulse can be as short as the specified  $t_{WP}$ .
