### General Description

The SY89833L is a 3.3V, high-speed 2 GHz differential, low voltage differential swing (LVDS) 1:4 fanout buffer optimized for ultra-low skew applications. Within device skew is guaranteed to be less than 20 ps over supply voltage and temperature.

The differential input buffer has a unique internal termination design that allows access to the termination network through a V<sub>T</sub> pin. This feature allows the device to easily interface to different logic standards. A V<sub>REF-AC</sub> reference is included for AC-coupled applications.

The SY89833L is part of Microchip's high-speed clock synchronization family. For 2.5V applications, the SY89832U provides similar functionality while operating from a 2.5V ±5% supply. For applications that require a different I/O combination, consult the Microchip website and choose from a comprehensive product line of high-speed, low-skew fanout buffers, translators, and clock generators.

## TEMPERATURE SPECIFICATIONS

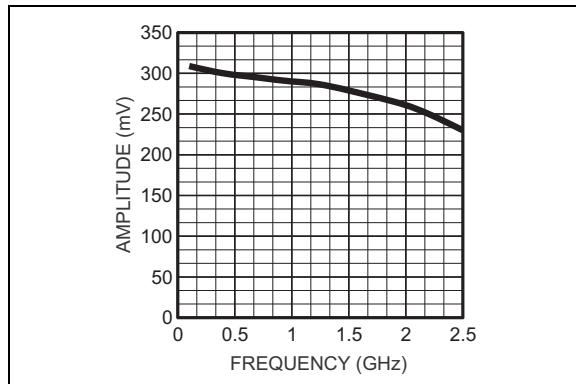

Parameters	Sym.	Min.	Typ.	Max.	Units	Conditions
<b>Temperature Ranges</b>						
Junction Operating Temperature	T <sub>J</sub>	—	—	+125	°C	Note 1
Storage Temperature Range	T <sub>S</sub>	-65	—	+150	°C	—
Lead Temperature	—	—	—	+260	°C	Soldering, 20s
<b>Package Thermal Resistances (Note 2)</b>						
16-pin 3 mm x 3 mm VQFN (Still-Air)	θ <sub>JA</sub>	—	60	—	°C/W	—
16-pin 3 mm x 3 mm VQFN	Ψ <sub>JB</sub>	—	33	—	°C/W	—

- Note 1:** The maximum allowable power dissipation is a function of ambient temperature, the maximum allowable junction temperature and the thermal resistance from junction to air (i.e., T<sub>A</sub>, T<sub>J</sub>, θ<sub>JA</sub>). Exceeding the maximum allowable power dissipation will cause the device operating junction temperature to exceed the maximum +125°C rating. Sustained junction temperatures above +125°C can impact the device reliability.
- 2:** Package thermal resistance assumes exposed pad is soldered (or equivalent) to the device's most negative potential on the PCB. Ψ<sub>JB</sub> and θ<sub>JA</sub> values are determined for a 4-layer board in still-air number, unless otherwise stated.

### 3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 3-1](#).

**TABLE 3-1: PIN FUNCTION TABLE**

Pin Number	Pin Name	Description
15, 16 1, 2 3, 4 5, 6	Q0, /Q0 Q1, /Q1 Q2, /Q2 Q3, /Q3	LVDS Differential Outputs: Normally terminated with $100\Omega$ across the pair (Q, /Q). See “LVDS Outputs” section. Unused outputs should be terminated with a $100\Omega$ resistor across each pair.
8	EN	This single-ended TTL/CMOS-compatible input functions as a synchronous output enable. The synchronous enable ensures that enable/disable will only occur when the outputs are in a logic low state. Note that this input is internally connected to a $25\text{ k}\Omega$ pull-up resistor and will default to logic high state (enabled) if left open.
9, 12	/IN, IN	Differential Inputs: These input pairs are the differential signal inputs to the device. Inputs accept AC- or DC-coupled differential signals as small as 100 mV. Each pin of a pair internally terminates to a $V_T$ pin through $50\Omega$ . Note that these inputs will default to an intermediate state if left open. Please refer to the <a href="#">Input Interface Applications</a> section for more details.
10	$V_{REF-AC}$	Reference Voltage: These outputs bias to $V_{CC} - 1.425\text{V}$ . They are used when AC coupling the inputs (IN, /IN). For AC-coupled applications, connect $V_{REF-AC}$ to $V_T$ pin and bypass with $0.01\ \mu\text{F}$ low-ESR capacitor to $V_{CC}$ . See the <a href="#">Input Interface Applications</a> section for more details. Maximum sink/source current is $\pm 1.5\ \text{mA}$ .
11	$V_T$	Input Termination Center-Tap: Each side of the differential input pair terminates to a $V_T$ pin. The $V_T$ pin provides a center-tap to a termination network for maximum interface flexibility. See the <a href="#">Input Interface Applications</a> section for more details.
13	GND	Ground. GND pin and exposed pad must be connected to the most negative potential of the device ground.
7, 14	$V_{CC}$	Positive Power Supply: Bypass with $0.1\ \mu\text{F}/0.01\ \mu\text{F}$ low-ESR capacitors and place as close as possible to each $V_{CC}$ pin.

## 5.0 LVDS OUTPUTS

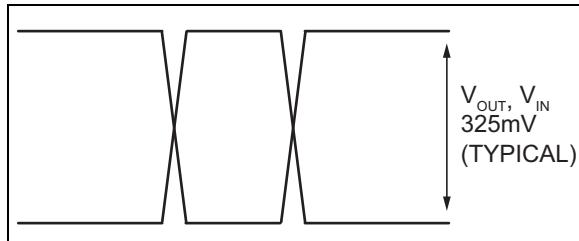

LVDS specifies a small swing of 325 mV typical, on a nominal 1.20V common-mode above ground. The common-mode voltage has tight limits to permit large variations in ground noise between a LVDS driver and receiver.
