

# End position controllers SPC11

# End position controllers SPC11

Key features

## Key features at a glance

Fast travel between two fixed stops with electronically controlled end position cushioning and up to two freely selectable intermediate positions.

- Up to 30% faster cycle rates
- Significantly reduced system vibration
- Fast problem-free commissioning, no specialists required
- Simple conversion of existing systems
- Optimum operating behaviour is maintained even with weight/load fluctuations of up to 30% of the total moving mass
- Less expensive than electromechanical drives
- Reduced noise level

## Individual components

### End position controller

Integrated functions:

- For determining system characteristic values of the connected components.
- Storage of the desired end positions or intermediate positions.

- Comparison of setpoint and actual position, and position control through appropriate actuation of the proportional 5/3-way valve (status control).
- Internal or external teach-in function.

SPC11

### Analogue displacement encoders

Analogue displacement encoder based on a conductive-plastic linear potentiometer. The system measures absolute values. It is connected alongside a pneumatic drive. Mounting kits are

available as accessories for the mechanical coupling. The displacement encoder is available in fixed stroke lengths ranging from 100 ... 2000 mm.

MLO-POT...-TLF

MLO-POT...-LWG

### Digital displacement encoders

Digital displacement encoders, magnetostrictive, contactless method of measurement. The system measures absolute values. It is connected alongside a pneumatic linear

drive. Mounting kits are available as accessories for the mechanical coupling. The displacement encoder is available in fixed stroke lengths ranging from 100 ... 2000 mm.

MME-MTS...-AIF

### Pneumatic drives

Pneumatic drives ensure an easy-to-operate system. The stroke length operating range depends on the selected drive. The range extends from 225 ... 2000 mm. The swivel angle with DSMI ranges from 0° ... 270°.

 Note  
The linear drives DGP/DGPL with compressed air supply connections at both ends (D2) should be used for effective cylinder strokes above 600 mm.

DGCI

DGPL, DGPLL

DNC

DNCI

DNCM

DSMI

### Proportional 5/3-way valves

Valve actuation is via the end position controller. The valve controls the volume of air supplied to the drive. The extremely short switching time of the valve makes the Smart Soft Stop solution package highly dynamic.

 Note  
Use a 5 µm filter for compressed air preparation. The compressed air supply must be un lubricated.

Key features

## Conventional solution

Previously you needed to

- Harmonise individual components.
- Install additional shock absorbers and possibly replace/exchange existing shock absorbers.
- Fit proximity sensors for position detection.
- Adjust the compressed air supply by means of flow control valves in order to optimise the system.

Until now, to create intermediate positions you had to

- Construct a complex mechanical solution using stopper cylinders, for example.
- Harmonise a large number of individual components.
- Perform extensive programming.

## Solution with end position controller SPC11

Fast travel between two fixed stops with up to two freely selectable intermediate positions

The Smart Soft Stop system with end position controller SPC11 facilitates travel between two fixed mechanical stops as well as travel to up to two freely selectable intermediate positions. The level of accuracy of the intermediate positions is  $\pm 0.25\%$  of the

displacement encoder length, and no less than  $\pm 2$  mm. The level of accuracy of the intermediate positions is  $\pm 2^\circ$  for the swivel module DSMI. Typical applications for the intermediate positions are rest or ejector positions, where a low-cost solution is more

important than achieving high levels of accuracy. The intermediate positions also have sensor functionality. This means that when the relevant intermediate position is passed, a 50 ms pulse is produced at the corresponding output.

# End position controllers SPC11

Key features

FESTO

## The Festo solution package

### Smart Soft Stop with end position controller SPC11

In an application with up to two intermediate positions you can now:

- Use the Festo solution package with a small number of harmonised components.
- Dispense with complex constructions using stopper cylinders.
- Approach the intermediate positions from both sides.
- Let optimisation be carried out by the learning system itself.

The Smart Soft Stop system with SPC11 has a remote input, which allows all three pushbuttons to be allocated to a master controller:

- All system parameters can be defined and changed externally.
- A signal at the remote input disables all pushbuttons on the end position controller SPC11.

- Proportional 5/3-way valve  
MPYE-5-...-010B
- Displacement encoder  
MLO-POT-...-TLF,  
MLO-POT-...-LWG or  
MME-MTS-...-AIF

- End position controller  
SPC11
- Valve cable  
KMPYE
- Controller cable  
KMPV-...
- Manual

Solution packages are uniquely defined, i.e. all components are harmonised for optimum performance. For details of this unique allocation please see → 19 or 39 or  
→ Smart Soft Stop software tool:  
[www.festo.com/en/engineering](http://www.festo.com/en/engineering)

Accessories available on separate order (fittings, tubing, etc.) can be found in the respective solution packages. An example of an order is shown on → 18 or 38.

PPV = Open the internal cushioning 100%

## Symmetrical

The desired travel distance should not therefore exceed the relevant effective cylinder stroke.

The following thus applies:

**travel distance ≤ effective cylinder stroke**

1 Fixed stops, mounted on drive or externally

## Asymmetrical

The desired travel distance within the effective cylinder stroke must be limited by means of fixed stops. The same applies to the pneumatic drives DGCI/DNC, DNCI, DNCM and DSMI.

1 Fixed stops, mounted on drive or externally

- - Note

External limit stops are required in order to realise the effective stroke (or effective swivel angle in the case of DSMI) when using the pneumatic

drives DGCI, DNC, DNCI, DNCM und DSMI with the Smart Soft Stop system.

# End position controllers SPC11

Key features

## The solution package

- Advantages**
- Up to 30% faster cycle rates
  - Significantly reduced system vibration
  - Optimum operating behaviour is maintained even with weight/load fluctuations of up to 30% of the total moving mass
  - Simple conversion of existing systems
  - Considerably reduced noise level
  - Fast problem-free commissioning, no specialists required
  - Less expensive than electromechanical drives

The graphs apply to the following example:

- DGPL-25-1250-PPV-A-KF-B-GK-...-D2,
- Moving load: 12 kg
- Horizontal mounting position

**Note**  
The shape of the curve is identical for the pneumatic drives DGCI, DNC, DNCI, DNCM, DSMI and DGPI.

1 = Drive with electronic end position controller SPC11  
2 = Drive with shock absorber  
x = Travel distance  
t = Time

1 = Drive with electronic end position controller SPC11  
2 = Drive with shock absorber  
v = Velocity  
t = Time

1 = Drive with electronic end position controller SPC11  
2 = Drive with shock absorber  
a = Acceleration  
t = Time

## Plug & work = Commissioning in just a few steps

- 1 Assemble the system components: Moving mass must be attached backlash-free.
- 2 Set up the pneumatic and electrical system connections.
- 3 Switch on the compressed air and supply voltage.
- 4 Start the teaching process by means of a button. The system learns autonomously and is ready for operation after 3 minutes.
- 5 Approach and save intermediate positions by means of buttons.

# End position controllers SPC11

Peripherals overview

## Variant with drive DGPIIL

-  - Note

The same components are required for the drive DGPIIL as for the drive DGPIIL.

The integrated digital displacement encoder of the DGPIIL is replaced by an externally mounted displacement encoder (either digital or potentiometric).

## End position controllers SPC11

Technical data

## Order example

For pneumatic linear drives DGCI

A workpiece weighing 3 kg is to be moved horizontally on a loading station. A workpiece gripper attached

to the slide of the linear drive weighs 14 kg. The total weight to be moved is therefore 17 kg. The desired travel

distance is 1,100 mm. The travel time is to be < 1.5 seconds.

### Step 1:

#### Selecting the cylinder stroke

For a travel distance of 1,100 mm, use the table on → 13 to select the next-largest effective cylinder stroke of 1,250 mm. This column has a grey background.

### Step 2:

#### Specifying the drive

For a total weight of 17 kg to be moved horizontally, there is a choice of piston diameters of 25, 32 and 40 mm (see data for max. total weight to be moved).

For the purposes of our example, the drive DGCI-32-1250-KF-..., part no. 544 427 has been selected.

### Step 3:

#### Specifying a proportional 5/3-way valve

The appropriate proportional 5/3-way valve is shown at the intersection of the grey column used in step 1 and the line for the selected linear drive DGCI-32-... in the "Proportional 5/3-way valve" section of the table. For the purposes of our example, the proportional 5/3-way valve MPYE-5-1/4-010B, part no. 151 694 has been selected.

### Step 4:

#### Completing the order information

To order a complete system you must add the data for the end position controller, valve and controller cables and manual (if required). The complete ordering data for our example can be found on → 13. A manual should normally be ordered. If you already have one, leave the appropriate box blank, indicating that you do not want a manual.

### Step 5:

#### Determining the travel time

To calculate the travel time use the "Smart Soft Stop" software tool. The travel time for the order example is 1.16 seconds.

Note

Sizing software  
Smart Soft Stop and ProDrive  
→ [www.festo.com](http://www.festo.com)

Note

Remember when selecting the drive mounting components that some of these are not backlash-free and therefore cannot be used with the Smart Soft Stop system. The drives must be mounted directly.

Note

Check that the loads placed on the drive by a gripper during movement do not exceed permissible limits. To carry out simulation quickly and easily, use the Smart Soft Stop software tool and ProDrive.

Note

For vertical travel,  $t_{up}$  and  $t_{down}$  are the two different travel times.

Technical data

## Order example

For pneumatic linear drives DGP/DGPL, DGPI/DGPIL

A workpiece weighing 3 kg is to be moved horizontally on a loading station. A workpiece gripper attached

to the slide of the linear drive weighs 14 kg. The total weight to be moved is therefore 17 kg. The desired travel

distance is 1,100 mm. The travel time is to be < 1.5 seconds.

### Step 1:

#### Selecting the cylinder stroke

For a travel distance of 1,100 mm, use the table on → 19 to select the next-largest effective cylinder stroke of 1,250 mm. This column has a grey background.

### Step 2:

#### Specifying the drive

For a total weight of 17 kg to be moved horizontally, there is a choice of piston diameters of 25, 32, 40, 50 and 63 mm (see data for max. total weight to be moved).

For the purposes of our example, the drive DGPL-32-1250-PPV-A-B-KF-GK-...-D2, part no. 175 135 has been selected.

### Step 3:

#### Specifying the displacement encoder

The appropriate length of the displacement encoder is governed by the effective cylinder stroke.

The column with the grey background in the “Displacement encoder” section of the table shows Part No. 152 633 for this example.

Alternatively, the digital displacement encoder MME-MTS-...-AIF can be used.

### Step 4:

#### Specifying a proportional 5/3-way valve

The appropriate proportional 5/3-way valve is shown at the intersection of the grey column used in step 1 and the line for the selected linear drive DGPL-32-... in the “Proportional 5/3-way valve” section of the table. For the purposes of our example, the proportional 5/3-way valve MPYE-5-1/4-010B, part no. 151 694 has been selected.

### Step 5:

#### Completing the order information

To order a complete system you must add the data for the end position controller, valve and controller cables and manual (if required). The complete ordering data for our example can be found on → 19. A manual should normally be ordered. If you already have one, leave the appropriate box blank, indicating that you do not want a manual.

### Step 6:

#### Determining the travel time

To calculate the travel time use the “Smart Soft Stop” software tool. The travel time for the order example is 1.16 seconds.

Note

Sizing software  
Smart Soft Stop and ProDrive  
→ [www.festo.com](http://www.festo.com)

Note

Remember when selecting the drive mounting components that some of these are not backlash-free and therefore cannot be used with the Smart Soft Stop system. The drives must be mounted directly.

Note

Check that the loads placed on the drive by a gripper during movement do not exceed permissible limits. To carry out simulation quickly and easily, use the Smart Soft Stop software tool and ProDrive.

Note

The moment compensator FKP is not backlash-free. It must not therefore be used in combination with linear drives DGP/DGPI.

Note

For vertical travel,  $t_{up}$  and  $t_{down}$  are the two different travel times.

Technical data

## Order example

For the pneumatic drive DNC with displacement encoder LWG

A workpiece weighing 55 kg is to be moved horizontally on a loading station. The workpiece gripper

attached to the piston rod of the drive weighs 40 kg. The total weight to be moved is therefore 95 kg. The desired

travel distance is 300 mm. The travel time is to be < 1.5 seconds.

### Step 1: Selecting the cylinder stroke

For a travel distance of 300 mm, use the table on → 25 to select the next-largest standard stroke of 320 mm or the effective cylinder stroke of 291 ... 350 mm. This column has a grey background.

### Step 2: Specifying the drive

For a total weight of 95 kg to be moved horizontally, there is a choice of piston diameters of 50, 63 and 80 mm (see data for max. total weight to be moved).

For the purposes of our example, the drive DNC-50-320-PPV-A, part no. 163 378 has been selected.

### Step 3: Specifying the displacement encoder

The appropriate length of the displacement encoder is governed by the effective cylinder stroke. The column with the grey background in the "Displacement encoder" section of the table shows Part No. 152 647 for this example.

#### Note

The linear potentiometer is supplied separately and must be mounted by the user.

### Step 4: Specifying a proportional 5/3-way valve

The appropriate proportional 5/3-way valve is shown at the intersection of the grey column used in step 1 and the line for the selected pneumatic drive DNC-50... in the "Proportional 5/3-way valve" section of the table. For the purposes of our example, the proportional 5/3-way valve MPYE-5-1/8-HF-010B, part no. 151 693 has been selected.

### Step 5: Completing the order information

To order a complete system you must add the data for the end position controller, valve and controller cables and manual (if required). The complete ordering data for our example can be found on → 25. A manual should normally be ordered. If you already have one, leave the appropriate box blank, indicating that you do not want a manual.

### Step 6: Determining the travel time

To calculate the travel time use the "Smart Soft Stop" software tool. The travel time for the order example is 0.96 seconds.

#### Note

Sizing software  
Smart Soft Stop and ProDrive  
→ [www.festo.com](http://www.festo.com)

#### Note

Remember when selecting the drive mounting components that some of these are not backlash-free and therefore cannot be used with the Smart Soft Stop system. The drives must be mounted directly.

#### Note

Check that the loads placed on the drive by a gripper during movement do not exceed permissible limits. To carry out simulation quickly and easily, use the Smart Soft Stop software tool.

#### Note

The self-aligning rod coupler FK is not backlash-free. It must not therefore be used in combination with standard cylinder DNC.

Technical data

## Order example

For pneumatic standard drive DNCI with integrated displacement encoder

A workpiece weighing 55 kg is to be moved horizontally on a loading station. The workpiece gripper

attached to the piston rod of the drive weighs 40 kg. The total weight to be moved is therefore 95 kg. The desired

travel distance is 300 mm. The travel time is to be < 1.5 seconds.

### Step 1: Selecting the cylinder stroke

For a travel distance of 300 mm, use the table on → 29 to select the next-largest standard stroke of 320 mm or the effective cylinder stroke of 320 mm. This column has a grey background.

### Step 2: Specifying the drive

For a total weight of 95 kg to be moved horizontally, there is a choice of piston diameters of 50 and 63 mm (see data for max. total weight to be moved).

For the purposes of our example, the drive DNCI-50-320-P-A, part no. 535 413 has been selected.

### Step 3: Specifying a proportional 5/3-way valve

The appropriate proportional 5/3-way valve is shown at the intersection of the grey column used in step 1 and the line for the selected pneumatic drive DNCI-50-... in the "Proportional 5/3-way valve" section of the table. For the purposes of our example, the proportional-5/3-way valve MPYE-5-1/8-HF-010B, part no. 151 693 has been selected.

### Step 4: Completing the order information

To order a complete system you must add the data for the end position controller, valve and controller cables and manual (if required). The complete ordering data for our example can be found on → 29. A manual should normally be ordered. If you already have one, leave the appropriate box blank, indicating that you do not want a manual.

### Step 5: Determining the travel time

To calculate the travel time use the "Smart Soft Stop" software tool. The travel time for the order example is 0.92 seconds.

-  - Note

Sizing software  
Smart Soft Stop and ProDrive  
→ [www.festo.com](http://www.festo.com)

-  - Note

Remember when selecting the drive mounting components that some of these are not backlash-free and therefore cannot be used with the Smart Soft Stop system. The drives must be mounted directly.

-  - Note

Check that the loads placed on the drive by a gripper during movement do not exceed permissible limits. To carry out simulation quickly and easily, use the Smart Soft Stop software tool.

-  - Note

The self-aligning rod coupler FK is not backlash-free. It must not therefore be used in combination with standard cylinder DNCI.

Technical data

## Order example

For the pneumatic drive DNCM with adapted displacement encoder LWH

A workpiece weighing 20 kg is to be moved horizontally on a handling station. An external guide is used to

accurately position the workpiece gripper which weighs 15 kg. The total weight is therefore 35 kg. The desired

travel distance is 180 mm. The travel time is to be < 1.0 seconds.

### Step 1: Selecting the cylinder stroke

For a travel distance of 180 mm, use the table on → 33 to select the next-largest standard stroke of 200 mm. This column has a grey background.

### Step 2: Specifying the drive

For a total weight of 35 kg to be moved horizontally, the piston diameter of 32 mm is selected. In the variant DNCM-...-FENG, the drive is equipped with a guide unit (with ball bearing guide) as well as the displacement encoder. The guide unit is mounted and tested at the factory. For the purposes of our example, the drive DNCM-32-200-P-POT2-FENG, part no. 528 940 has been selected.

### Step 3: Displacement encoder

The appropriate displacement encoder for the drive is mounted and tested at the factory.

### Step 4: Specifying a proportional 5/3-way valve

The appropriate proportional 5/3-way valve is shown at the intersection of the grey column used in step 1 and the line for the selected pneumatic drive DNCM-32-... in the "Proportional 5/3-way valve" section of the table. For the purposes of our example, the proportional-5/3-way valve MPYE-5-1/8-LF-010B, part no. 151 692 has been selected.

### Step 5: Completing the order information

To order a complete system you must add the data for the end position controller, valve and controller cables and manual (if required). The complete ordering data for our example can be found on → 33. A manual should normally be ordered. If you already have one, leave the appropriate box blank, indicating that you do not want a manual.

### Step 6: Determining the travel time

To calculate the travel time use the "Smart Soft Stop" software tool. The travel time for the order example is 0.69 seconds.

-  - Note

Sizing software  
Smart Soft Stop and ProDrive  
→ [www.festo.com](http://www.festo.com)

-  - Note

Remember when selecting the drive mounting components that some of these are not backlash-free and therefore cannot be used with the Smart Soft Stop system. The drives must be mounted directly.

-  - Note

Check that the loads placed on the drive by a gripper during movement do not exceed permissible limits. To carry out simulation quickly and easily, use the Smart Soft Stop software tool.

-  - Note

The self-aligning rod coupler FK is not backlash-free. It must not therefore be used in combination with standard cylinder DNCM.

Technical data

## Order example for swivel module DSMI

A workpiece with a mass moment of inertia of  $400 \text{ kgm}^2 \times 10^{-4}$  is to be moved on an unloading station. The workpiece gripper attached to the

shaft of the swivel module has a mass moment of inertia of  $230 \text{ kgm}^2 \times 10^{-4}$ . The total mass moment of inertia to be moved is therefore  $630 \text{ kgm}^2 \times 10^{-4}$ .

The swivel angle is  $250^\circ$ . The travel time is to be  $< 1$  second.

- Note

Sizing software  
Smart Soft Stop and ProDrive  
→ [www.festo.com](http://www.festo.com)

- Note

Remember when selecting the drive mounting components that some of these are not backlash-free and therefore cannot be used with the Smart Soft Stop system. The drives must be mounted directly.

- Note

Check that the loads placed on the drive by a gripper during the movement process do not exceed permissible limits.  
To carry out simulation quickly and easily, use the Smart Soft Stop software tool.

### Step 1: Specifying the swivel angle

The maximum swivel angle of the swivel modules DSMI-25-270 and DSMI-40-270 is  $270^\circ$  and can be fully exploited. The integrated displacement encoder is appropriately designed.

### Step 2: Specifying the drive

DSMI-40-270 must be used for the total mass moment of inertia of  $630 \text{ kgm}^2 \times 10^{-4}$  to be moved horizontally  
→ 39.

### Step 3: Specifying a proportional 5/3-way valve

As can be seen from the table → 39, the proportional 5/3-way valve MPYE-5-1/8-LF-010B is generally required for swivel module DSMI-40-270.

### Step 4: Completing the order information

To order a complete system you must add the data for the end position controller, valve and controller cables and manual (if required). The complete ordering data for our example can be found on → 39. A manual should normally be ordered. If you already have one, leave the appropriate box blank, indicating an express waiver of a manual.

### Step 5: Determining the travel time

To calculate the travel time use the "Smart Soft Stop" software tool. The travel time for the order example is 0.89 seconds.

# End position controllers SPC11

Technical data

## Converting existing systems

<b>What are the points to note when converting existing systems that use the pneumatic drives DGP/DGPL or DNC?</b>	Optimum system behaviour is guaranteed by Festo's uniquely specified solution packages, in which	all components are harmonised. When converting existing systems, observe the following points:	
<b>Where could system behaviour possibly change when an existing system is converted?</b>	In normal cases, the entire cylinder stroke is used, including the internal	cushioning length (PPV); no stroke reserve is available.	
<b>What should be noted when installing the pneumatics?</b>	<ul style="list-style-type: none"> <li>Make sure that the system configuration is symmetrical, i.e. that the tubing used to connect the compressed air supply to each end of the cylinder is of identical length.</li> </ul>	<ul style="list-style-type: none"> <li>No flow controls between the valve and cylinder.</li> <li>Open the end-position cushioning (PPV) 100%.</li> </ul>	Accessories and tubing diameters can be found in the description for the respective solution package.
<b>What should be noted when installing the electrics?</b>	As far as the electrical actuation is concerned, the Smart Soft Stop system behaves like a standard pneumatic	system with a double solenoid valve and two proximity sensors.	For further information see the manual System description: SPC11-... → 43.
<b>Does the control program need to be adapted?</b>	Existing systems which have provision for two digital inputs/outputs can be	converted without adaptation of the control program.	
<b>What proportional 5/3-way valve should be selected for the conversion project?</b>	Exactly the same valve as specified in the solution packages on → 19 or 25.		

**What end position controller is suitable for each drive or displacement encoder?**

# Product Range and Company Overview

## A Complete Suite of Automation Services

Our experienced engineers provide complete support at every stage of your development process, including: conceptualization, analysis, engineering, design, assembly, documentation, validation, and production.

**Custom Automation Components**  
Complete custom engineered solutions

**Custom Control Cabinets**  
Comprehensive engineering support and on-site services

**Complete Systems**  
Shipment, stocking and storage services

## The Broadest Range of Automation Components

With a comprehensive line of more than 30,000 automation components, Festo is capable of solving the most complex automation requirements.

**Electromechanical**  
Electromechanical actuators, motors, controllers & drives

**Pneumatics**  
Pneumatic linear and rotary actuators, valves, and air supply

**PLCs and I/O Devices**  
PLC's, operator interfaces, sensors and I/O devices

## Supporting Advanced Automation... As No One Else Can!

Festo is a leading global manufacturer of pneumatic and electromechanical systems, components and controls for industrial automation, with more than 12,000 employees in 56 national headquarters serving more than 180 countries. For more than 80 years, Festo has continuously elevated the state of manufacturing with innovations and optimized motion control solutions that deliver higher performing, more profitable automated manufacturing and processing equipment. Our dedication to the advancement of automation extends beyond technology to the education and development of current and future automation and robotics designers with simulation tools, teaching programs, and on-site services.

## Quality Assurance, ISO 9001 and ISO 14001 Certifications

Festo Corporation is committed to supply all Festo products and services that will meet or exceed our customers' requirements in product quality, delivery, customer service and satisfaction.

To meet this commitment, we strive to ensure a consistent, integrated, and systematic approach to management that will meet or exceed the requirements of the ISO 9001 standard for Quality Management and the ISO 14001 standard for Environmental Management.
