

**SERIES:** PQA100-0 | **DESCRIPTION:** DC-DC CONVERTER

**FEATURES**

- 100 W isolated output
- industry standard DOSA 1/8 brick
- 2:1 input range (36 ~75 Vdc)
- -40 ~ 100°C operating temperature with derating
- over-current, input under-voltage, over-voltage and output short-circuit protection
- remote on/off control
- EN/BS EN 62368 certified

- Notes:
1. Ripple and noise are measured at 20 MHz BW by "tip and barrel" method, nominal input & 5%~100% load. Ripple and noise at <5% load is 5% Vo max.
  2. Efficiency is measured in nominal input voltage and rated output load.
  3. Unless otherwise specified, parameters in this datasheet were measured under the conditions of Ta=25°C, humidity<75%RH with nominal input voltage and rated output load.
  4. The products do not support parallel connection of their output.

## RIPPLE AND NOISE

All the DC-DC converters of this series are tested before delivery using the recommended circuit shown in Figure 1.

**Table 1**

Capacitor value / Output voltage	C0	C1	C2	C3
5 Vdc	100μF/100V	1μF/50V	10μF/50V	330μF/63V
12 Vdc				
15 Vdc				
24 Vdc				
28 Vdc				

## APPLICATION DESIGN REFERENCE

It is recommended to use CUI's EMC circuit, otherwise please ensure that at least a 100μF electrolytic capacitors is connected at the input in order to ensure adequate voltage surge suppression and protection.

Input and/or output ripple can be further reduced by appropriately increasing the input & output capacitor values  $C_{in}$  and  $C_{out}$  and/or by selecting capacitors with a low ESR (equivalent series resistance). Also make sure that the capacitance is not exceeding the specified max. capacitive load value of the product.

**Figure 2**

## TRIM FUNCTION

### TRIM FUNCTION FOR OUTPUT VOLTAGE ADJUSTMENT (OPEN IF UNUSED)

Figure 5

Trim up

Trim down

$$R_{\text{TRIM}} = \left( \frac{5.11 V_{\text{NOM}} (100 + \Delta\%)}{1.225 \times \Delta\%} - \frac{511}{\Delta\%} - 10.22 \right) (\text{K } \Omega)$$

When the output voltage is 12V, the up-regulated voltage is +10%, that is, the output voltage set to 13.2V:

$$R_{\text{TRIM}} = \left( \frac{5.11 \times 12 (100 + 10)}{1.225 \times 10} - \frac{511}{10} - 10.22 \right) = 489 (\text{K } \Omega)$$

$$\Delta\% = \left( \frac{12 - 13.2}{12} \right) \times 100 = 10$$

Formula for Trim up

$$R_{\text{TRIM}} = \left( \frac{511}{\Delta\%} \right) - 10.22 (\text{K } \Omega)$$

When the output voltage is 12V, the down-regulated voltage is -10%, that is, the output voltage set to 10.8V:

$$\Delta\% = \left( \frac{12 - 10.8}{12} \right) \times 100 = 10$$

$$R_{\text{TRIM}} = \frac{511}{10} - 10.22 = 40.88 (\text{K } \Omega)$$

Formula for Trim down

$$\Delta\% = \left( \frac{V_{\text{NOM}} - V_{\text{OUT}}}{V_{\text{NOM}}} \right) \times 100$$

Note:  $R_{\text{TRIM}}$ : Trim resistance  
 $V_{\text{NOM}}$ : Nominal output voltage  
 $V_{\text{OUT}}$ : Desired output voltage

## HOT TEST POINT

---

The thermal element is installed on the top surface of the product and dissipates heat to the surrounding environment through conduction, convection, and radiation. Sufficient heat dissipation conditions should be provided to ensure the reliable operation of the product.

By measuring the temperature of the thermal test point (see Fig. 6), it can be verified whether the heat dissipation conditions are met.

**Figure 6**

Note: The temperature of the hot test point cannot exceed 130°C, otherwise the product will trigger protection due to excessive temperature and cannot work normally.

## REMOTE SENSE APPLICATION

Figure 7

### REMOTE SENSE CONNECTION IF NOT USED

- Note:
1. Lines must be kept as short as possible.
  2. If the sense function is not used for remote regulation the user must connect the +Sense to + Vo and -Sense to 0V at the DC-DC converter pins and will compensate for voltage drop across pins only.
  3. The connections between Sense lines and their respective power lines must be kept as short as possible, otherwise they may be picking up noise, interference and/or causing unstable operation of the power module.

Figure 8

### REMOTE SENSE CONNECTION USED FOR COMPENSATION

- Note:
1. In cables and discrete wiring applications, twisted pair or other techniques should be implemented.
  2. Using remote sense with long wires may cause unstable output, please contact technical support if long wires must be used.
  3. PCB-tracks or cables/wires for Remote Sense must be kept as short as possible. Twisted pair or shielded wairs are suggested for remote compensation and must be kept as short as possible.
  4. We recommend using adequate cross section for PCB-track layout and/or cables to connect the power supply module to the load in order to keep the voltage drop below 0.3V and to make sure the power supply's output voltage remains within the specified range.
  5. Note that large wire impedance may cause oscillation of the output voltage and/or increased ripple. Consult technical support or factory for further advice of sense operation.
