

Automotive IPD Series

4ch Low Side Switch

BD4LB650EFV-C

General Description

BD4LB650EFV-C is a 4-channel SPI-input low side switch for automotive and industrial application. It has built-in open load detection function, short ground detection function, over current protection function, thermal shutdown function, and active clamp function.

Features

- AEC-Q100 Qualified^(Note 1)
- Monolithic Power Management IC with Control Block (CMOS) and a Power MOSFET Mounted on a Single Chip
- Channel Control/error can be Detected by 16 bit SPI Commands.
- Built-in Open Load Detection Function (OLD)
- Built-in Short Ground Detection Function (SGD)
- Built-in Over Current Protection Function (OCP)
- Built-in Thermal Shutdown Function(TSD)
- Built-in Active Clamp Function
- Built-in Synchro Mode
- Built-in Limp Home Mode
- Surface-mount HTSSOP-B20 Packaging
(Note 1) Grade1

Key Specifications

- Power Supply Operating Range: 4.0 V to 5.5 V
- On State Resistance: 650 mΩ (Typ)
- Over Current Threshold Value: 0.5 A/1.0 A (Min)
- Active Clamp Energy: 125 mJ
- Operating Temperature Range Tj:-40 °C to +150 °C

Package

HTSSOP-B20

W (Typ) x D (Typ) x H (Max)

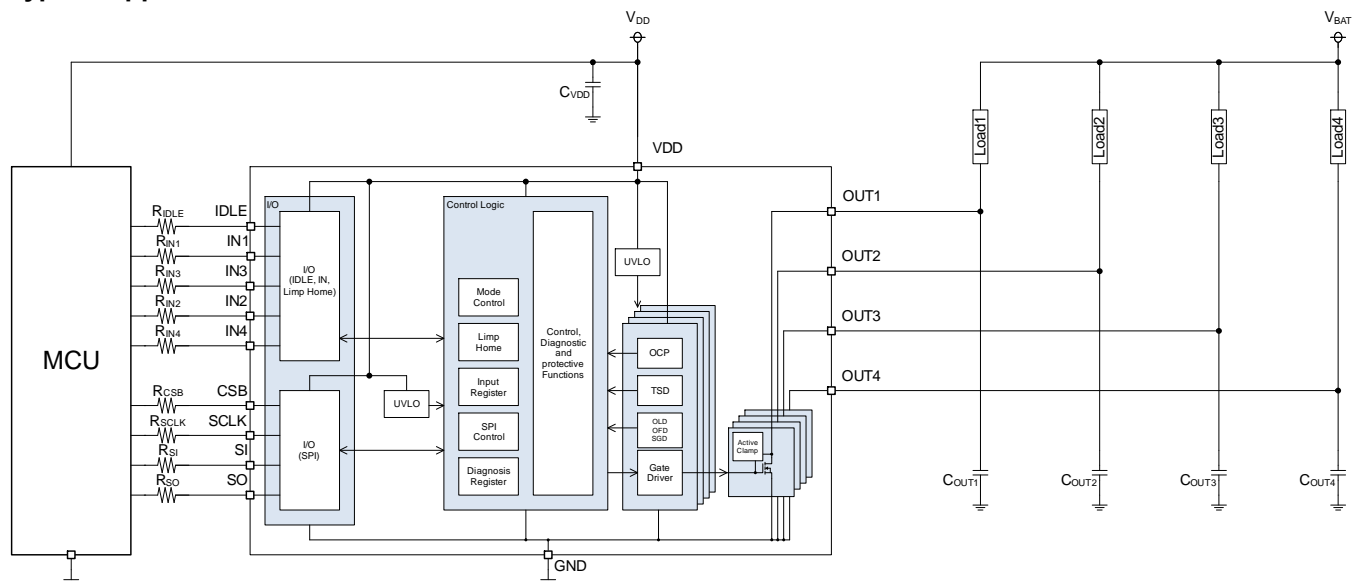

6.5 mm x 6.4 mm x 1.0 mm

Application

- Driving Resistive and Inductive Load

Typical Application Circuit

○Product structure : Silicon integrated circuit ○This product has no designed protection against radioactive rays.

Pin Configuration

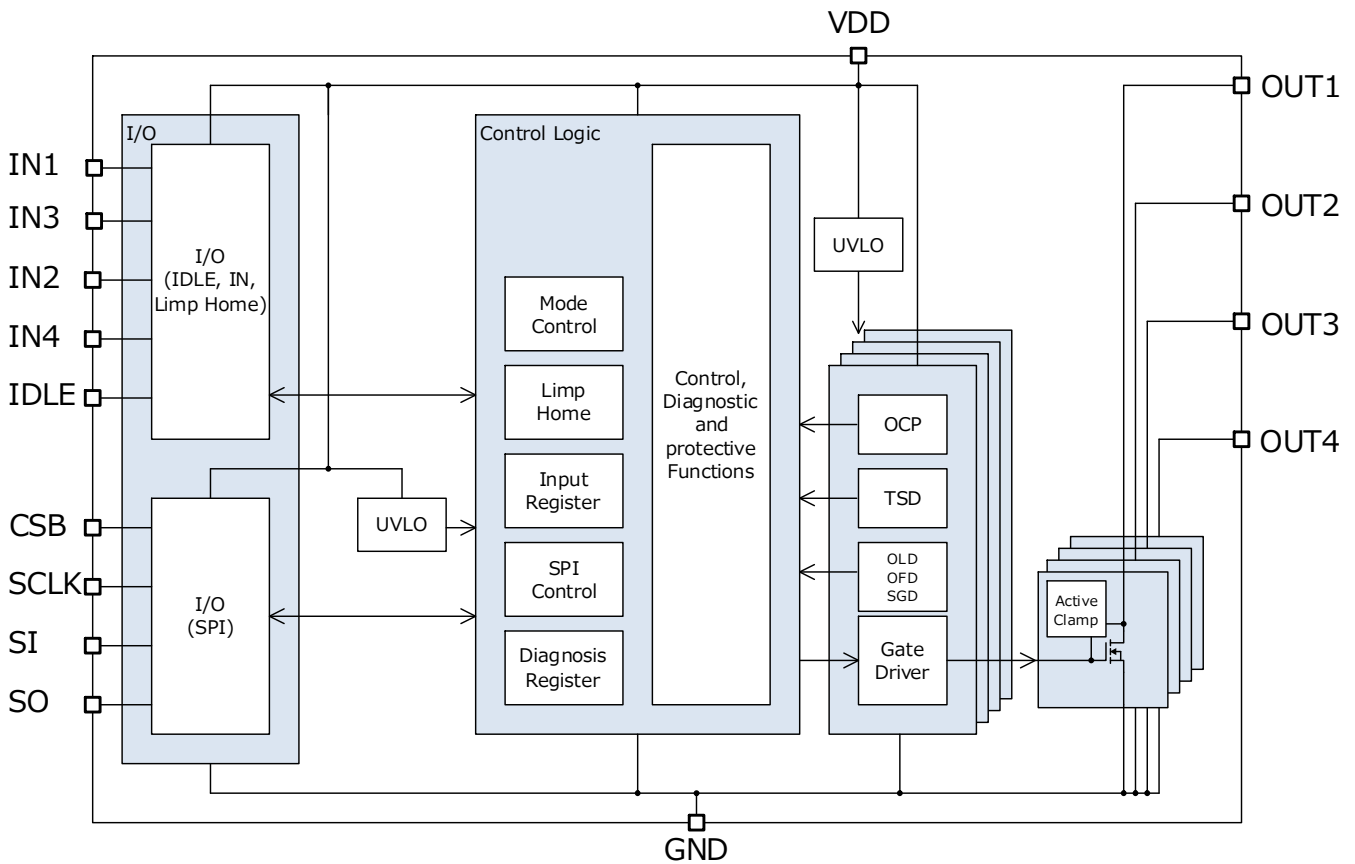

Pin Descriptions

Pin No.	Pin Name	Function
1	IDLE	Limp home mode control This pin is connected to GND via an internal pull-down resistor.
2	CSB	SPI enable This pin is connected to VDD via an internal pull-up resistor.
3	SCLK	Serial clock input This pin is connected to GND via an internal pull-down resistor.
4	SI	Serial data input This pin is connected to GND via an internal pull-down resistor.
5	SO	Serial data output
6	GND	GND
7	OUT1	ch1 output
8	OUT2	ch2 output
9	N.C.	Not connected
10	N.C.	Not connected
11	N.C.	Not connected
12	N.C.	Not connected
13	OUT4	ch4 output
14	OUT3	ch3 output
15	GND	GND
16	IN4	ch4 control This pin is connected to GND via an internal pull-down resistor.
17	IN2	ch2 control This pin is connected to GND via an internal pull-down resistor.
18	IN3	ch3 control This pin is connected to GND via an internal pull-down resistor.
19	IN1	ch1 control This pin is connected to GND via an internal pull-down resistor.
20	VDD	Analog power supply
-	EXP-PAD	Be sure to connect EXP-PAD to GND.

Block Diagram

Absolute Maximum Ratings (Tj = 25 °C)

Parameter	Symbol	Rating	Unit
VDD Power Supply Voltage	V _{DD}	-0.3 to +7	V
Output Voltage (Power MOS Output)	V _{OUT1-4}	-0.3 to (Internal Limit) ^(Note 1)	V
Output Current (Power MOS Output)	I _{OUT1-4}	(Internal Limit) ^(Note 2)	A
Output Voltage (SPI)	V _{SO}	-0.3 to +7	V
Input Voltage (IDLE)	V _{IDLE}	-0.3 to +7	V
Input Voltage (SPI)	V _{CSB} , V _{SCLK} , V _{SI}	-0.3 to +7	V
Input Voltage (IN1, IN2, IN3, IN4)	V _{IN1} , V _{IN2} , V _{IN3} , V _{IN4}	-0.3 to +7	V
Storage Temperature Range	T _{stg}	-55 to +150	°C
Maximum Junction Temperature	T _{jmax}	150	°C
Active Clamp Energy (Single Pulse) T _{J(START)} = 25 °C, I _{OUT1-4(START)} = 0.4 A	E _{AS1-4(25 °C)}	125	mJ
Active Clamp Energy (Single Pulse) ^(Note 3) T _{J(START)} = 150 °C, I _{OUT1-4(START)} = 0.4 A	E _{AS1-4(150 °C)}	20	mJ
Active Clamp Energy (Single Pulse) T _{J(START)} = 25 °C, I _{OUT1-4(START)} = 0.8 A, Synchro Mode	E _{S, AS1-4(25 °C)}	57	mJ
Active Clamp Energy (Single Pulse) ^(Note 3) T _{J(START)} = 150 °C, I _{OUT1-4(START)} = 0.8 A, Synchro Mode	E _{S, AS1-4(150 °C)}	19	mJ
Active Clamp Energy (Repetitive) ^{(Note 3)(Note 4)} T _{J(START)} = 125 °C, I _{OUT(START)} = 0.2 A	E _{AR(125 °C)}	12	mJ
Active Clamp Energy (Repetitive) ^{(Note 3)(Note 4)} T _{J(START)} = 125 °C, I _{OUT(START)} = 0.4 A, Synchro Mode	E _{S, AR(125 °C)}	9	mJ

(Note 1) Limited by the active clamp function.

(Note 2) Limited by the over current protection function. The over current detection value can be adjusted in two levels.

(Note 3) Not 100 % are tested.

(Note 4) 2M cycles, All channel input.

Caution 1: Operating the IC over the absolute maximum ratings may damage the IC. The damage can either be a short circuit between pins or an open circuit between pins and the internal circuitry. Therefore, it is important to consider circuit protection measures, such as adding a fuse, in case the IC is operated over the absolute maximum ratings.

Caution 2: Should by any chance the maximum junction temperature rating be exceeded the rise in temperature of the chip may result in deterioration of the properties of the chip. In case of exceeding this absolute maximum rating, design a PCB with thermal resistance taken into consideration by increasing board size and copper area so as not to exceed the maximum junction temperature rating.

Caution 3: When IC is turned off with an inductive load, reverse energy has to be dissipated in the IC. This energy can be calculated by the following equation:

$$E_L = \frac{1}{2} L I_{OUT(START)}^2 \times \left(1 - \frac{V_{BAT}}{V_{BAT} - V_{OUT(CL)}} \right)$$

Where:

L is the inductance of the inductive load.

I_{OUT(START)} is the output current at the time of turning off.

V_{OUT(CL)} is the output clamp voltage.

The IC integrates the active clamp function to internally absorb the reverse energy E_L which is generated when the inductive load is turned off. When the active clamp operates, the thermal shutdown function does not work. Decide a load so that the reverse energy E_L is active clamp energy E_{AS} (Figure 1.), E_{S,AS} (Figure 2.) or under when inductive load is used.

Timing Chart

The following shows the sequence when H is input to the IDLE pin after the power is supplied.
 "xx" denotes each input (1, 3, 2, 4), and n denotes the channel number.

(Supplement) About Each Symbol

t_{SETUP} : Time from VDD reaches operating voltage until H can be input to IDLE.

t_{SPI_START} : Time from H is input to IDLE until SPI communication is available.

t_{INxx_ON} : Time from H is input to IDLE until control by INxx is available.

t_{SPI_END} : Time from completion of SPI communication until L is input L to IDLE ^(Note 1).

t_{IDLE_OFF} : Time from end of control by INxx until input L to IDLE.

t_{ONn} : Turn-On time

t_{OFFn} : Turn-Off time

t_{OFFn_Max} : Turn-Off Time (Max)

$t_{SHUTDOWN}$: Time from input L to IDLE until VDD is turned off.

^(Note 1) If using SPI control to turn off low side SW, wait t_{IDLE_OFF} before inputting L to IDLE.

Timing Chart – continued

The following shows the sequence when the VDD and IDLE pins are simultaneously turned on/off. "xx" denotes each input (1, 3, 2, 4), and n denotes the channel number.

(Supplement) About Each Symbol

t_{SPI_START}: Time from H is input to IDLE until SPI communication is available.

t_{INxx_ON}: Time from VDD reaches operating voltage until control by INxx is available.

t_{SPI_END}: Time from completion of SPI communication until lowering VDD ^(Note 1).

t_{VDD_OFF}: Time from end of control by INxx until lowering VDD.

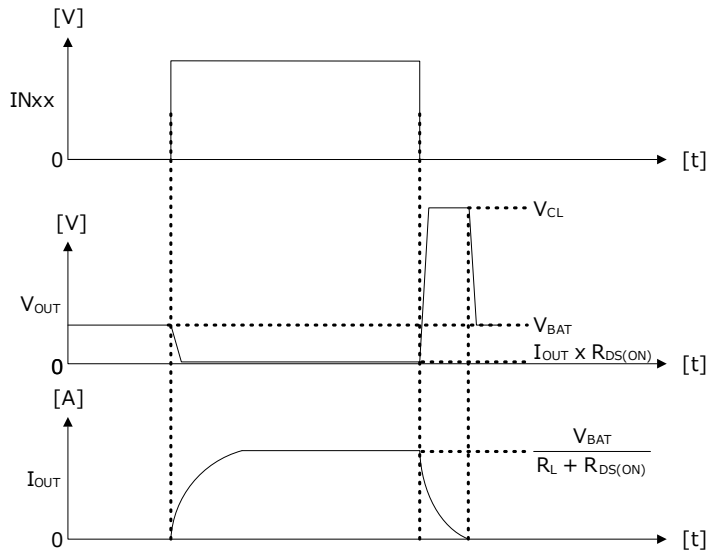

t_{ONn}: Turn-On time

t_{OFFn}: Turn-Off time

t_{OFFn_Max}: Turn-Off time (Max)

^(Note 1) If using SPI control to turn off low side SW, wait t_{VDD_OFF} before lowering VDD.

Inductive Load Operation

Synchro Mode

Two adjacent output pins can be connected in parallel. Parallel connection is available by combining OUT1/OUT2, OUT3/OUT4. The synchro mode can be set by SPI. For details, refer to "Register Map".

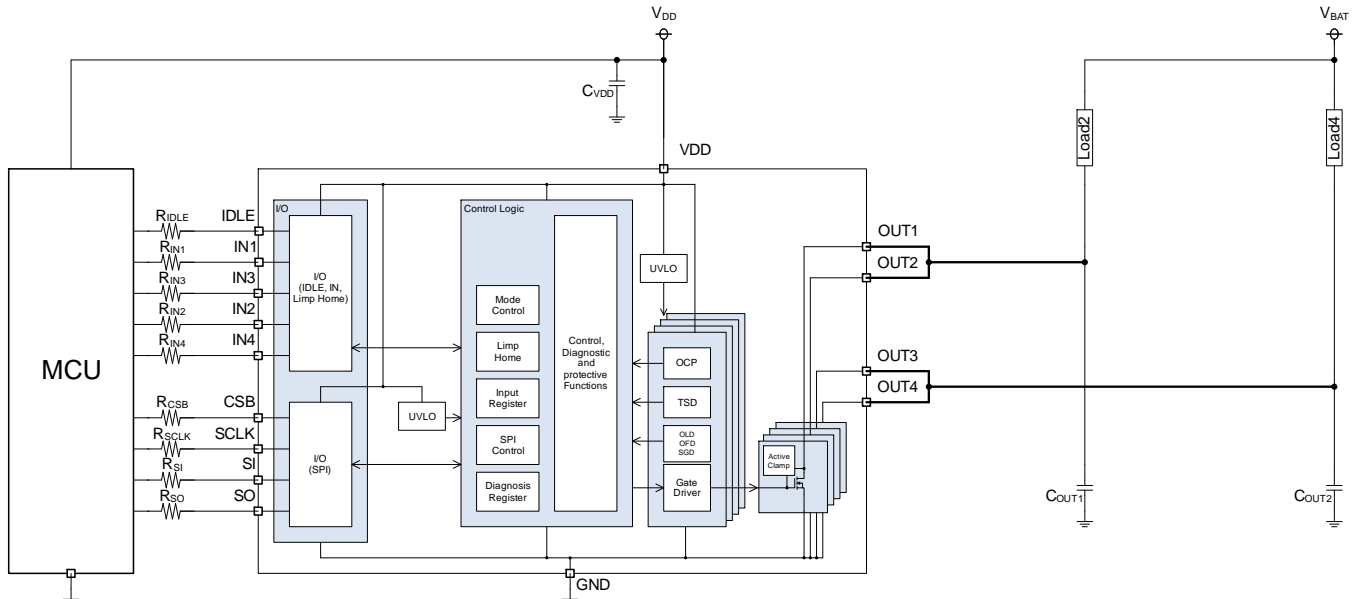

When controlling by IN1/IN2/IN3/IN4, channels connected in parallel are driven simultaneously.

All control by SPI is set from the odd number channel, and the even number channel setting is ignored. For example, to turn on OUT1/OUT2, write "1" to OUTCTRL1 bit of OUTCTRL register. Writing to OUTCTRL2 bit is ignored.

Over current protection and thermal shutdown is active on each channel connected in parallel, and both channels are turned off when protection is detected in either channel.

The detection of protection can be read from SPI by accessing DIAG_OUT4321 register.

The error flag is output from the odd number channel and the error flag of the even number channel is fixed to "0". For example, if over current protection is detected in OUT1/OUT2, "1" is output from DIAG_OCP1 bit of DIAG_OUT4321 register, and DIAG_OCP2 bit outputs "0".

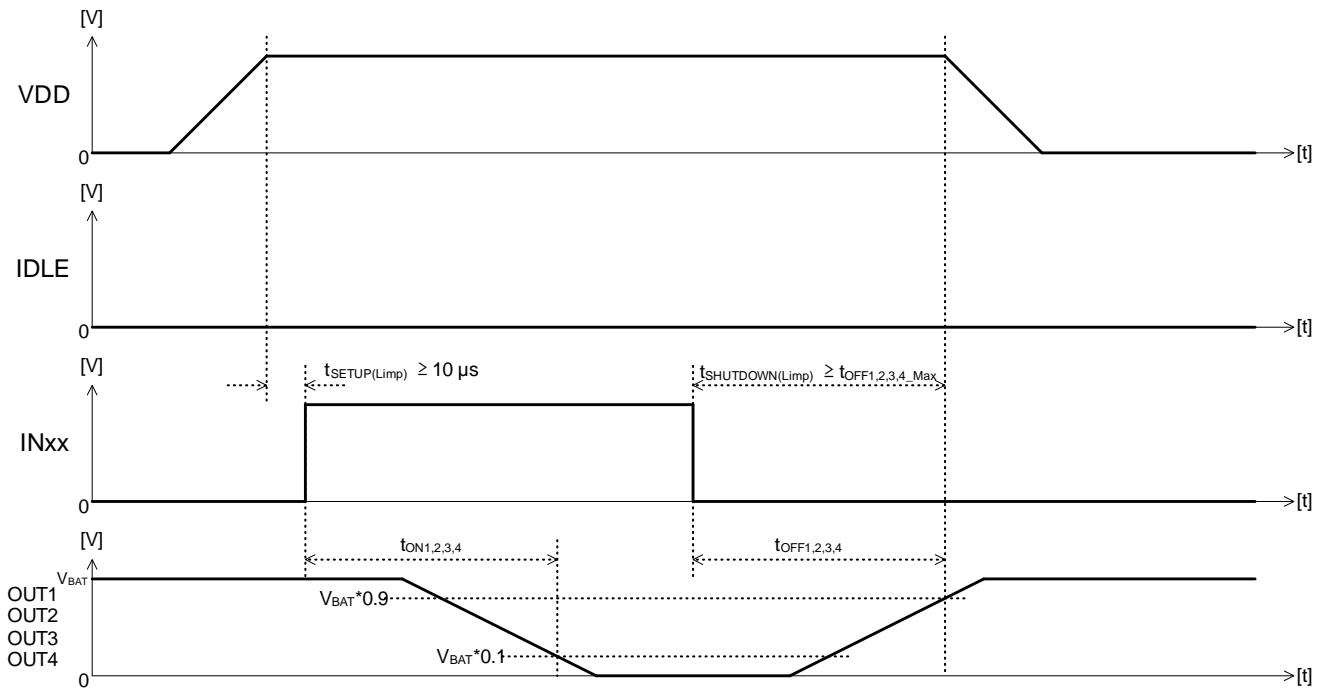

Caution: Differences in wire impedance between two neighboring outputs may affect characteristics such as turn-On/Off, slew rate, over current threshold value, and active clamp energy. To avoid this, it is recommended to short output pin with near the IC as possible.

Limp Home Mode

When IDLE is set to L, the IC enters Limp Home mode. This mode enables operation with low current consumption. Control by SPI is not possible in this mode, but on/off control by IN1/IN2/IN3/IN4 is available. When IDLE becomes L, the register is cleared and returns to the default setting.

The timing chart in Limp Home mode is shown below.

(Supplement) About Each Symbol

$t_{SETUP(Limp)}$: Time from VDD reaches operating voltage until control by INxx is available.

$t_{ON1,2,3,4}$: Turn-On time

$t_{OFF1,2,3,4}$: Turn-Off time

$t_{OFF1,2,3,4_Max}$: Turn-Off time (Max)

$t_{SHUTDOWN(Limp)}$: Time from all INxx is set to L until VDD is turned off.

SPI Specification

SPI overview

When CSB = H

SO is High-Z.

When CSB = L

Outputs to SO at the rising edge of SCLK.

SI is loaded into the register at the falling edge of SCLK.

SPI protocol

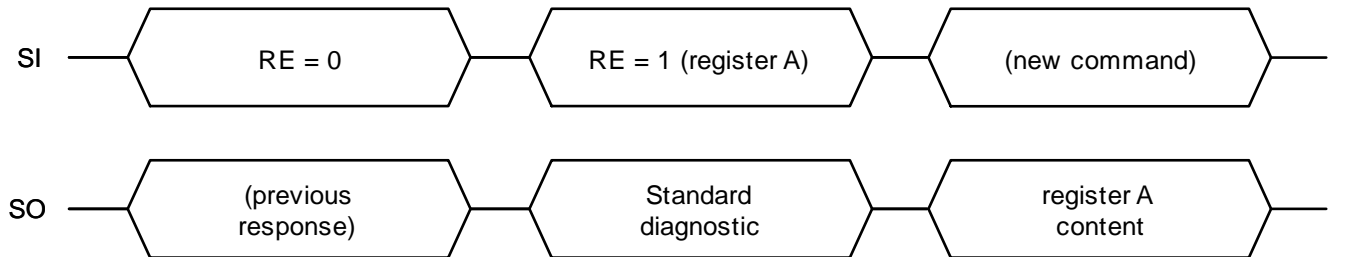

The SO response to SPI access is returned at the next SPI access as shown in the following figure.

·Response when accessing with RE = 0 and with RE = 1

When accessing with RE = 0, respond "Standard diagnostic".

When accessing with RE = 1, respond the value of the specified register.

SPI Specification – continued

Serial Daisy Chain

Multiple devices can be connected in series as shown below.

For CSB signal and SCLK signal, connect a common signal. About SI / SO line, SO of Device 1 can be connected to SI of Device 2 as shown below.

The timing chart when eight devices are connected is shown below.

Parallel Connection

Multiple devices can be connected in parallel as shown below.

For SI signal, SCLK signal, and SO signal, connect a common signal. Separate signals are required for the CSB signal for each device.

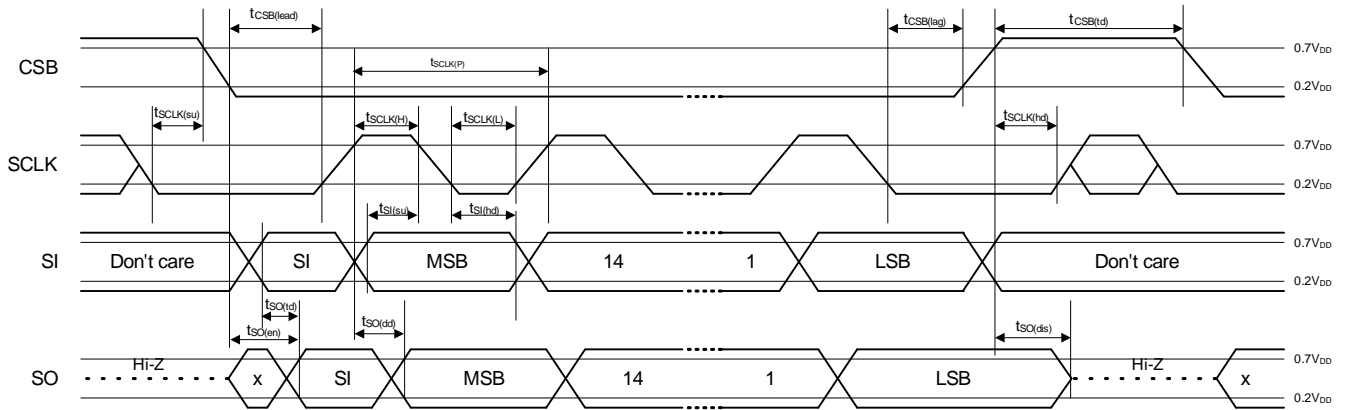

The timing chart when two devices are connected is shown below.

SPI Specification – continued

SPI Timing chart

Parameter	Symbol	Min	Typ	Max	Unit
SCLK Frequency	f _{SCLK}	0	-	5	MHz

RE	WE	Address					TEST	Data							

RE

0: SO outputs "Standard diagnostic" at the next SPI access.

1: SO outputs the register specified by Address at the next SPI access.

WE

0: Not Write.

1: Write.

TEST

Be sure to set 0.

Data

When WE = 1, various settings are enabled by writing '0' or '1' to Data.

For details, refer to "Register Map".

"Standard diagnostic" (when RE = 0 in the previous SPI access)

Initial Value 0x4000

Bit[15]	Bit[14]	Bit[13]	Bit[12]	Bit[11]	Bit[10]	Bit[9]	Bit[8]	Bit[7]	Bit[6]	Bit[5]	Bit[4]	Bit[3]	Bit[2]	Bit[1]	Bit[0]
0	INIT	0	0	0	TER	0	0	0	0	0	0	ERR4	ERR3	ERR2	ERR1

INIT

0: Normal (after power on or IDLE = 'L'-'>'H', from the second time SPI access).

1: After power on or IDLE = 'L'-'>'H', first time SPI access.

TER

0: Normal

1: SPI communication error

When High pulse input of SCLK is other than (16 times + 8 x m, m is an integer 0 or above) in the low level section of CSB, a communication error is judged.

ERRn (n is the channel number)

0: Normal

1: The value is latched and output when over current protection or thermal shutdown of the corresponding channel is detected.

This bit is cleared by reading DIAG register (DIAG_OUT4321) of the channel on which protection is detected.

SO output data structure (when RE = 1 in the previous SPI access)

Bit[15]	Bit[14]	Bit[13]	Bit[12]	Bit[11]	Bit[10]	Bit[9]	Bit[8]	Bit[7]	Bit[6]	Bit[5]	Bit[4]	Bit[3]	Bit[2]	Bit[1]	Bit[0]
1	WE	Address					ERR _{ALL}	Data							

WE, Address

Outputs WE and Address values that were set during the previous SPI access.

ERR_{ALL}

Outputs 1 when either over current protection or thermal shutdown of OUT is detected on at least one channel.

Data

Outputs the register value of Address that were set during the previous SPI access.

Over Current Protection Function

Turns off the output when an over current error occurs in the output (A in the figure). The output returns to on when the output stop time of 1 ms (Typ) has passed. However, if an over current error still continue at this time, the output will be turned off again (B in the figure). When an over current error is improved, the output recovers after the output stop time from over current error is lastly detected has passed (C in the figure).

If an over current error is detected, the internal over current detection flag outputs '1' (A' in the figure). This flag can be read from SPI read access or from Standard diagnostic. When the flag is read by SPI read access, it is cleared by the next SPI access after read access (D in the figure).

(Note 1) Output on/off control signal. This signal is controlled by IN1, IN2, IN3, IN4 or OUT_CTRL register.

When an over current error is detected in multiple channels, the output off time is measured starting from the channel that over current error was detected lastly.

For example, if an over current error is detected in ch2 after an over current error is detected in ch1 before the output off time of ch1 passes, the time t_{SHORT} from ch1 detects an error until an error is detected in ch2 will be added to the output off time of ch1.

Thermal Shutdown Function

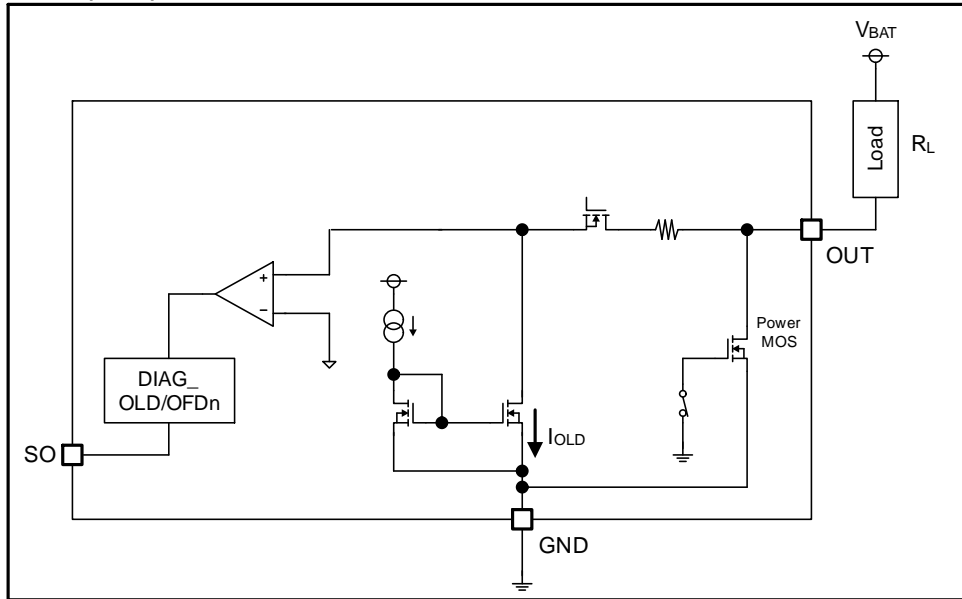

Turns off the output when the junction temperature rises 175 °C (Typ) or above (A in the figure). After that, the output automatically returns to on when the junction temperature falls 160 °C (Typ) or below (B in the figure).

When thermal shutdown is detected, the internal thermal shutdown flag outputs '1' (A in the figure). This flag can be read from SPI read access or Standard diagnostic. When the flag is read by SPI read access, it is cleared by the next SPI access after read access (C in the figure).

(Note 1) Output on/off control signal. This signal is controlled by IN1, IN2, IN3, IN4 or OUT_CTRL register.

Open Load Detection (OLD)

When OLD is enabled, output sink current I_{OLD} flows from OUT. The output voltage V_{OUT} drops when the load R_L increases, and it is detected as OLD when it becomes V_{OLD_DET} or less.

R_L for detecting OLDs is given by the following equation:

$$R_L \geq \frac{V_{BAT} - V_{OLD_DET}}{I_{OLD}}$$

- V_{BAT} : Battery voltage
- V_{OLD_DET} : Open load detection voltage 3.2 V (Max)
- I_{OLD} : Output sink current when OLD function is active 90 μ A (Max)

When the output is off, OLD can be enabled and diagnosed by one SPI access of write and read access (RE = 1, WE = 1) to DIAG_OLDD/OFD register (B, F in the figure). Diagnostic is output to SO at the next SPI access (D, H in the figure). At this time, OLD returns to inactive (D, H in the figure). When OUTn voltage is V_{OLD_DET} or less, OLD is diagnosed as detected and the error flag inside the IC outputs "0" (C in the figure). If OUTn voltage is V_{OLD_REL} or more, OLD is diagnosed as undetected and the error flag output '1' (G in the figure).

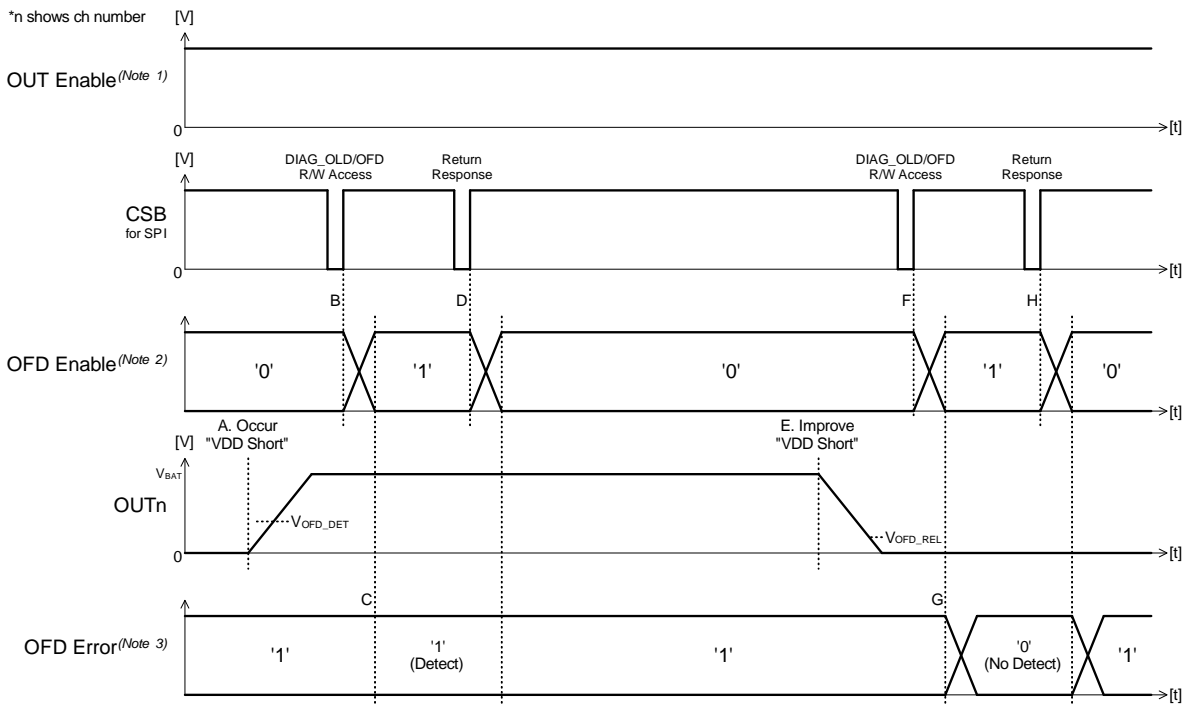

(Note 1) Output on/off control signal. This signal is controlled by IN1, IN2, IN3, IN4 or OUT_CTRL register.
 (Note 2) Internal enable signal. High and Low indicates enabled and disabled, respectively. This signal is controlled by write access to DIAG_OLDD/OFD register.
 (Note 3) Internal error flag. High and Low indicates error undetected and detected, respectively. Also the flag outputs High during disable. This signal can be retrieved to SO by read access to DIAG_OLDD/OFD register.

Output Overhead Fault Detection Function (OFD)

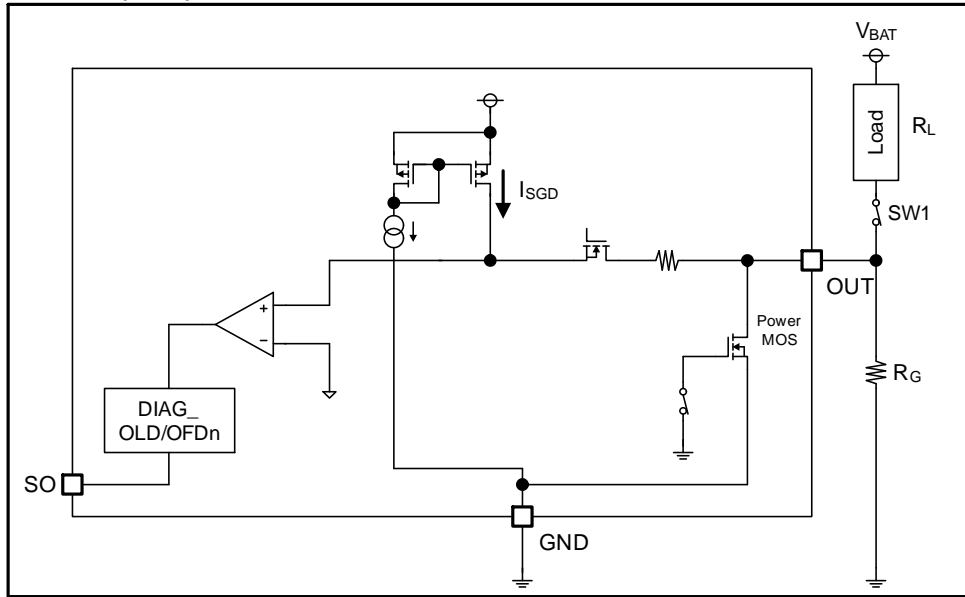

When the output is on, OFD can be enabled and diagnosed by one SPI access by write and read access (RE = 1, WE = 1) to DIAG_OLDFn register (B, F in the figure). Diagnostic is output to SO at the next SPI access (D, H in the figure). At this time, OFD returns to be inactive (D, H in the figure). When OUTn voltage is V_{OFD_DET} or more, OFD is diagnosed as detected and the error flag inside the IC outputs "1" (C in the figure). If OUTn voltage is V_{OFD_REL} or less, OFD is diagnosed as undetected and the error flag output '0' (G in the figure).

(Note 1) Output on/off control signal. High and Low indicates on and off, respectively. This signal is controlled by IN1, IN2, IN3, IN4 or OUT_CTRL register.
 (Note 2) Internal enable signal. High and Low indicates enabled and disabled, respectively. This signal is controlled by write access to DIAG_OLDFn register.
 (Note 3) Internal error flag. High and Low indicates error detected and undetected, respectively. Also the flag outputs High during disable. This signal can be retrieved to SO by read access to DIAG_OLDFn register.

Short Ground Detection (SGD)

·When normal load is connected (SW1 is on)

The output voltage V_{OUT} is determined by the divided voltage between R_L (normal load) and R_G (OUT-GND impedance) and it is detected as SGD when V_{OUT} is V_{SGD_DET} or less.

R_G for detecting SGD is given roughly by the following equation.

$$R_G \leq \frac{V_{SGD_DET}}{V_{BAT} - V_{SGD_DET}} * R_L$$

V_{BAT} : Battery voltage

V_{SGD_DET} : Short ground detection voltage 0.3 V (Min)

·When the load is open (SW1 is off)

The output voltage V_{OUT} is obtained from output source current I_{SGD} that flows into R_G and it is detected as SGD when V_{OUT} is V_{SGD_DET} or less.

R_G for detecting SGD is given by the following equation.

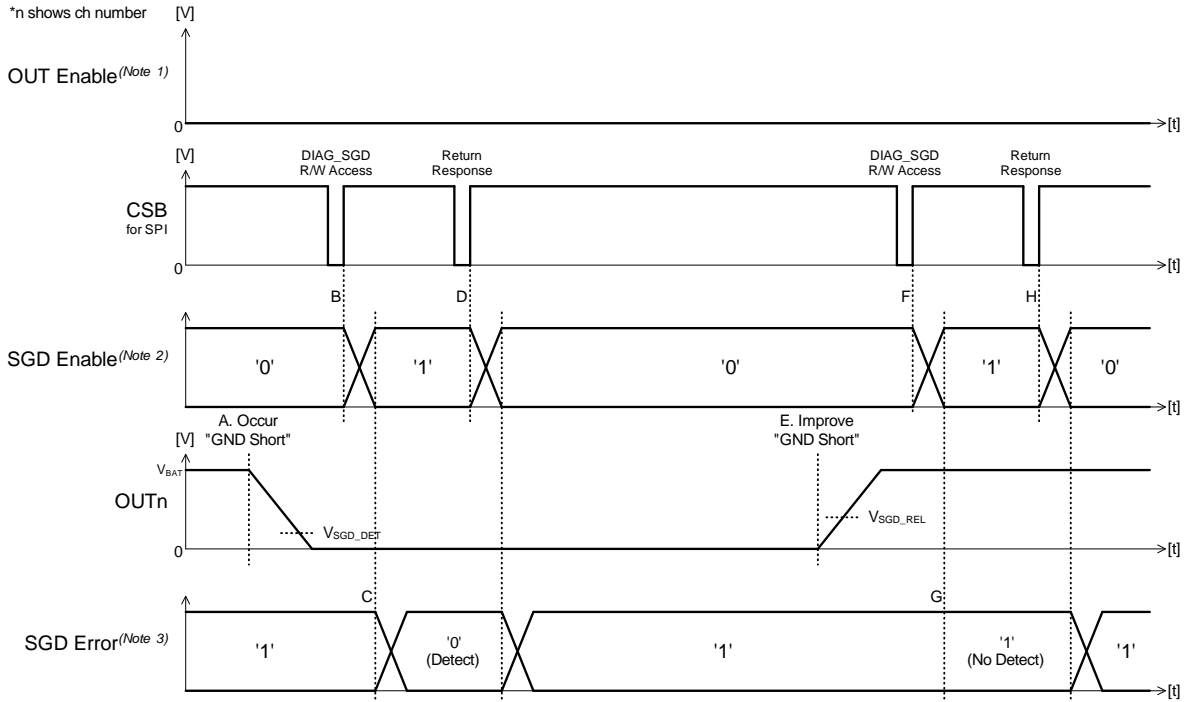

$$R_G \leq \frac{V_{SGD_DET}}{I_{SGD}}$$

V_{SGD_DET} : Short ground detection voltage 0.3 V (Min)

I_{SGD} : Output source current when SGD function is active 40 μ A (Max)

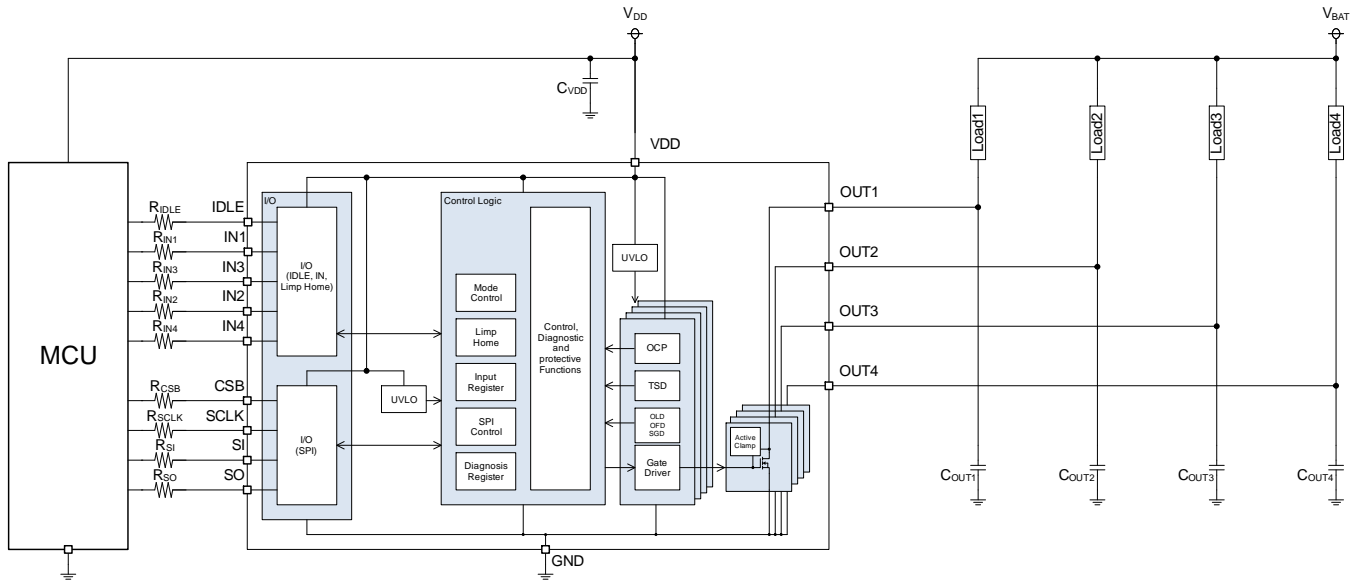

Short Ground Detection (SGD) – continued

When the output is off, SGD can be enabled and diagnosed by one SPI access of write and read access (RE = 1, WE = 1) to DIAG_SGD register (B, F in the figure). Diagnostic is output to SO at the next SPI access. At this time, SGD returns to be inactive (D, H in the figure). When OUTn voltage is V_{SGD_DET} or less, SGD is diagnosed as detected and the error flag inside the IC outputs "0" (C in the figure). If OUTn voltage is V_{SGD_REL} or more, SGD is diagnosed as undetected and the error flag output '1' (G in the figure).

(Note 1) Output on/off control signal. This signal is controlled by IN1, IN2, IN3, IN4 or OUT_CTRL register.
 (Note 2) Internal enable signal. High and Low indicates enabled and disabled, respectively. This signal is controlled by write access to DIAG_SGD register.
 (Note 3) Internal error flag. High and Low indicates error undetected and detected, respectively. Also the flag outputs High during disable. This signal can be retrieved to SO by read access to DIAG_SGD register.

Application Example

Selection of Components Externally Connected

Symbol	Value	Purpose
R _{IDLE}	1 kΩ	Register for microcontroller protection against negative voltage surge
R _{IN1} , R _{IN2} , R _{IN3} , R _{IN4}	1 kΩ	Register for microcontroller protection against negative voltage surge
R _{CSB} , R _{SCLK} , R _{SI} , R _{SO}	1 kΩ	Register for microcontroller protection against negative voltage surge
C _{VDD}	0.1 μF	Capacitor for noise removal on the power supply line
C _{OUT1} to C _{OUT4}	0.1 μF	Capacitor for ESD surge and BCI protection

As a precaution in selecting a C_{OUT}, current flows from the capacitor when the switch is turned on. Depending on the capacitance, over current protection may be detected. This current depends on the slew rate setting, over current protection setting, and V_{BAT} voltage. As a reference, capacitance that can be used with V_{BAT} = 18 V without over current protection when the switch is turned on is shown in the below table.

V _{BAT} = 18 V		
Slew Rate setting	Over Current Protection setting	Capacitance value that over current protection is not detected (Max)
SRCTRLn[1:0] = 00	OCPCTRLn = 0	0.22 μF
	OCPCTRLn = 1	0.22 μF
SRCTRLn[1:0] = 01	OCPCTRLn = 0	0.47 μF
	OCPCTRLn = 1	0.83 μF
SRCTRLn[1:0] = 10	OCPCTRLn = 0	0.68 μF
	OCPCTRLn = 1	1.5 μF

I/O Equivalence Circuits

Pin No.	Pin Name	I/O Equivalence Circuit
1	IDLE	
2	CSB	
3, 4 16 to 19	SCLK SI IN4 IN2 IN3 IN1	
5	SO	
6, 15	GND	-
7, 8 13, 14	OUT1, OUT2 OUT4, OUT3	
9 to 12	N.C.	-
20	VDD	-

Operational Notes

1. Reverse Connection of Power Supply

Connecting the power supply in reverse polarity can damage the IC. Take precautions against reverse polarity when connecting the power supply, such as mounting an external diode between the power supply and the IC's power supply pins.

2. Power Supply Lines

Design the PCB layout pattern to provide low impedance supply lines. Separate the ground and supply lines of the digital and analog blocks to prevent noise in the ground and supply lines of the digital block from affecting the analog block. Furthermore, connect a capacitor to ground at all power supply pins. Consider the effect of temperature and aging on the capacitance value when using electrolytic capacitors.

3. Ground Voltage

Ensure that no pins are at a voltage below that of the ground pin at any time, even during transient condition.

4. Ground Wiring Pattern

When using both small-signal and large-current ground traces, the two ground traces should be routed separately but connected to a single ground at the reference point of the application board to avoid fluctuations in the small-signal ground caused by large currents. Also ensure that the ground traces of external components do not cause variations on the ground voltage. The ground lines must be as short and thick as possible to reduce line impedance.

5. Recommended Operating Conditions

The function and operation of the IC are guaranteed within the range specified by the recommended operating conditions. The characteristic values are guaranteed only under the conditions of each item specified by the electrical characteristics.

6. Inrush Current

When power is first supplied to the IC, it is possible that the internal logic may be unstable and inrush current may flow instantaneously due to the internal powering sequence and delays, especially if the IC has more than one power supply. Therefore, give special consideration to power coupling capacitance, power wiring, width of ground wiring, and routing of connections.

7. Testing on Application Boards

When testing the IC on an application board, connecting a capacitor directly to a low-impedance output pin may subject the IC to stress. Always discharge capacitors completely after each process or step. The IC's power supply should always be turned off completely before connecting or removing it from the test setup during the inspection process. To prevent damage from static discharge, ground the IC during assembly and use similar precautions during transport and storage.

8. Inter-pin Short and Mounting Errors

Ensure that the direction and position are correct when mounting the IC on the PCB. Incorrect mounting may result in damaging the IC. Avoid nearby pins being shorted to each other especially to ground, power supply and output pin. Inter-pin shorts could be due to many reasons such as metal particles, water droplets (in very humid environment) and unintentional solder bridge deposited in between pins during assembly to name a few.

9. Unused Input Pins

Input pins of an IC are often connected to the gate of a MOS transistor. The gate has extremely high impedance and extremely low capacitance. If left unconnected, the electric field from the outside can easily charge it. The small charge acquired in this way is enough to produce a significant effect on the conduction through the transistor and cause unexpected operation of the IC. So unless otherwise specified, unused input pins should be connected to the power supply or ground line.

Operational Notes – continued

10. Regarding the Input and Output Pins of the IC

This monolithic IC contains P+ isolation and P substrate layers between adjacent elements in order to keep them isolated. P-N junctions are formed at the intersection of the P layers with the N layers of other elements, creating a parasitic diode or transistor. For example (refer to figure below):

When $GND > Pin A$ and $GND > Pin B$, the P-N junction operates as a parasitic diode.

When $GND > Pin B$, the P-N junction operates as a parasitic transistor.

Parasitic diodes inevitably occur in the structure of the IC. The operation of parasitic diodes can result in mutual interference among circuits, operational faults, or physical damage. Therefore, conditions that cause these diodes to operate, such as applying a voltage lower than the GND voltage to an input pin (and thus to the P substrate) should be avoided.

Figure 54. Example of Monolithic IC Structure

11. Ceramic Capacitor

When using a ceramic capacitor, determine a capacitance value considering the change of capacitance with temperature and the decrease in nominal capacitance due to DC bias and others.

12. Thermal Shutdown Function (TSD)

This IC has a built-in thermal shutdown function that prevents heat damage to the IC. Normal operation should always be within the IC's maximum junction temperature rating. If however the rating is exceeded for a continued period, the junction temperature (T_j) will rise which will activate the TSD function that will turn OFF power output pins. When the T_j falls below the TSD threshold, the circuits are automatically restored to normal operation.

Note that the TSD function operates in a situation that exceeds the absolute maximum ratings and therefore, under no circumstances, should the TSD function be used in a set design or for any purpose other than protecting the IC from heat damage.

13. Over Current Protection Function (OCP)

This IC incorporates an integrated overcurrent protection function that is activated when the load is shorted. This protection function is effective in preventing damage due to sudden and unexpected incidents. However, the IC should not be used in applications characterized by continuous operation or transitioning of the protection function.

14. Active Clamp Operation

The IC integrates the active clamp function to internally absorb the reverse energy E_L which is generated when the inductive load is turned off. When the active clamp operates, the thermal shutdown function does not work. Decide a load so that the reverse energy E_L is active clamp tolerance E_{AS} (refer to Figure 1.), $E_{S,AS}$ (refer to Figure 2.) or under when inductive load is used.

Operational Notes – continued

15. Power Supply Step Fluctuation

If the voltage of the power supply pin (VDD) falls sharply, the output pin (OUT) may temporarily turn off as shown in Figure 55. If the power supply pin is expected to fall sharply, take measures such as inserting a capacitor between the power supply pin and the ground pin so that it falls within the recommended usage range shown in Figure 56.

Figure 55. Output OFF operation when power supply fluctuates sharply

Figure 56. Recommended use range

16. GND Pin Connection

Connect all ground pins to ground.

Notice

Precaution on using ROHM Products

1. If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment ^(Note 1), aircraft/spacecraft, nuclear power controllers, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM's Products for Specific Applications.

(Note1) Medical Equipment Classification of the Specific Applications

JAPAN	USA	EU	CHINA
CLASS III	CLASS III	CLASS II b	CLASS III
CLASS IV		CLASS III	

2. ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
 - [a] Installation of protection circuits or other protective devices to improve system safety
 - [b] Installation of redundant circuits to reduce the impact of single or multiple circuit failure
3. Our Products are not designed under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM's Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc. prior to use, must be necessary:
 - [a] Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
 - [b] Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
 - [c] Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl₂, H₂S, NH₃, SO₂, and NO₂
 - [d] Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
 - [e] Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
 - [f] Sealing or coating our Products with resin or other coating materials
 - [g] Use of our Products without cleaning residue of flux (Exclude cases where no-clean type fluxes is used. However, recommend sufficiently about the residue.); or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
 - [h] Use of the Products in places subject to dew condensation
4. The Products are not subject to radiation-proof design.
5. Please verify and confirm characteristics of the final or mounted products in using the Products.
6. In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse, is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.
7. De-rate Power Dissipation depending on ambient temperature. When used in sealed area, confirm that it is the use in the range that does not exceed the maximum junction temperature.
8. Confirm that operation temperature is within the specified range described in the product specification.
9. ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

Precaution for Mounting / Circuit board design

1. When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.
2. In principle, the reflow soldering method must be used on a surface-mount products, the flow soldering method must be used on a through hole mount products. If the flow soldering method is preferred on a surface-mount products, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification

Precautions Regarding Application Examples and External Circuits

1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.
2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

Precaution for Electrostatic

This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of Ionizer, friction prevention and temperature / humidity control).

Precaution for Storage / Transportation

1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
 - [a] the Products are exposed to sea winds or corrosive gases, including Cl₂, H₂S, NH₃, SO₂, and NO₂
 - [b] the temperature or humidity exceeds those recommended by ROHM
 - [c] the Products are exposed to direct sunshine or condensation
 - [d] the Products are exposed to high Electrostatic
2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.
3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.
4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

Precaution for Product Label

A two-dimensional barcode printed on ROHM Products label is for ROHM's internal use only.

Precaution for Disposition

When disposing Products please dispose them properly using an authorized industry waste company.

Precaution for Foreign Exchange and Foreign Trade act

Since concerned goods might be fallen under listed items of export control prescribed by Foreign exchange and Foreign trade act, please consult with ROHM in case of export.

Precaution Regarding Intellectual Property Rights

1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data.
2. ROHM shall not have any obligations where the claims, actions or demands arising from the combination of the Products with other articles such as components, circuits, systems or external equipment (including software).
3. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the Products or the information contained in this document. Provided, however, that ROHM will not assert its intellectual property rights or other rights against you or your customers to the extent necessary to manufacture or sell products containing the Products, subject to the terms and conditions herein.

Other Precaution

1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.
2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.
3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.
4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.

General Precaution

1. Before you use our Products, you are requested to carefully read this document and fully understand its contents. ROHM shall not be in any way responsible or liable for failure, malfunction or accident arising from the use of any ROHM's Products against warning, caution or note contained in this document.
2. All information contained in this document is current as of the issuing date and subject to change without any prior notice. Before purchasing or using ROHM's Products, please confirm the latest information with a ROHM sales representative.
3. The information contained in this document is provided on an "as is" basis and ROHM does not warrant that all information contained in this document is accurate and/or error-free. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties resulting from inaccuracy or errors of or concerning such information.
