INTRODUCTION

DAC series modules are a range of products that can be controlled through I2C or PWM signals to generate voltage or current output signals. They possess the capability to produce a variety of analog voltage or current signals, including 0-5V, 0-10V, 0-2.5V, 0-VCC, and 0-25mA.

An analog quantity refers to the continuous variation of voltage magnitude (or current magnitude) within a specific range. Due to its stability, long transmission distance, and ease of use, it has found widespread application in the field of industrial automation control, including:

- Motor speed control
 - Sound intensity control
 - Temperature regulation
 - Adjustment of light brightness
 - Valve angle modulation
- etc.

[INTRODUCTION](#)

DFR1034-GP8503 (2-
Channel 12bit I2C to 0-
2.5V/VCC DAC Module)

[FUNCTIONS](#)[FEATURES](#)[DIMENSION](#)[FUNCTIONAL DIAGRAM](#)[SPECIFICATIONS](#)[TUTORIAL](#)[More Documents](#)[FAQ](#)

This series of DAC products not only offers a variety of output signal ranges, but also provides three selectable resolutions: 8-bit, 12-bit, and 15-bit. It allows for the choice of either single-channel or dual-channel configurations, and multiple modules can be cascaded to form a multi-channel output. When coupled with Arduino controllers, Raspberry Pi, STM32, and similar controllers, it finds application in various automation control scenarios, including:

- Laboratory testing equipment
- Automatic motor speed control
- Indoor and outdoor lighting control
- Automated volume adjustment
- Backlight control for displays
- etc.

The following table presents the functional parameters of each DAC product for reference in the selection process.

DFR1034-GP8503 (2-Channel 12bit I2C to 0-2.5V/VCC DAC Module)

FUNCTIONS

This is a 2-channel analog voltage output DAC module with I2C communication, 12-bit resolution, and 0.1% output voltage linearity error. It is well-suited for control projects operating within the 3.3V range, such as ESP32, Raspberry Pi, STM32, and other microcontrollers that require analog signal output.

FAQ

- Support 3.3V-5V power supply.
- Output voltage linearity error of 0.1%.
- Two channels of voltage output, either 0-2.5V or 0-VCC, enabling connection and control of standard analog voltage devices.
- Gravity interface, I2C communication, Arduino control, suitable for program automation control.

TUTORIAL

In this example, we will demonstrate the output of different voltage values in two states.

Input signal value range: 0-4095

In the state of 0-2.5V:

- Channel 0 inputs 2654, resulting in an output of 1.62V.
- Channel 1 inputs 1095, resulting in an output of 0.668V.

In the state of 0-VCC:

- Channel 0 inputs 2654, resulting in an output of 3.23V.
- Channel 1 inputs 1095, resulting in an output of 1.334V.

Name	Description	Remarks
	GND	Negative terminal of the output voltage signal

SPECIFICATIONS

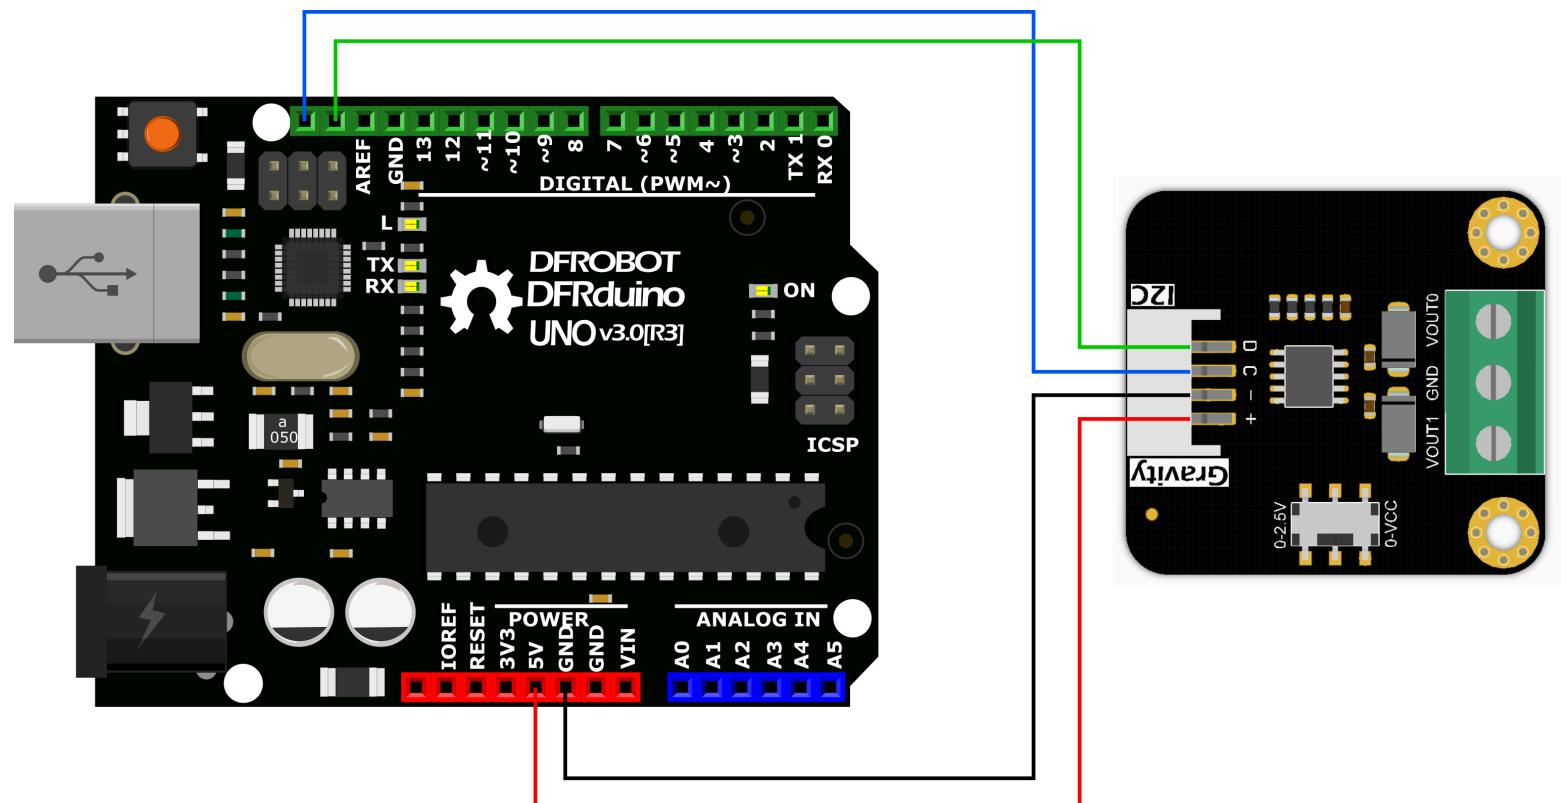

- Chip Type: GP8503
- Operating Voltage: 3.3V-5V
- Output Voltage: 0-2.5V or 0-VCC
- Number of Channels: 2 channels
- Communication Method: I2C
- Resolution: 12-bit
- Value Range: 0 - 4095 corresponding to 0-2.5V or 0-VCC
- Output voltage linearity error: 0.1%

SOFTWARE REQUIREMENTS

- Download Arduino IDE: [Click to download Arduino IDE \(https://www.arduino.cc/en/Main/Software\)](https://www.arduino.cc/en/Main/Software)
 - Download Arduino libraries: [Click to download https://github.com/DFRobot/DFRobot_GP8XXX](https://github.com/DFRobot/DFRobot_GP8XXX)
https://github.com/DFRobot/DFRobot_GP8XXX
- Click the link to view: How to install the library?; (<http://www.dfrobot.com.cn/community/forum.php?mod=viewthread&tid=1854&page=1&extra=#pid6955>)

Note: All modules in this series utilize the same library.

HARDWARE CONNECTION

SAMPLE CODE

```
#include <DFRobot_GP8XXX.h>

DFRobot_GP8503 GP8503;

void setup() {

    Serial.begin(9600);

    while(GP8503.begin()!=0){
        Serial.println("Communication with the device has encountered a failure. Please verify th
        delay(1000);
    }

    /**
     * @brief Configuring different channel outputs for DAC values
     * @param data Data values corresponding to voltage values
     * @n (0 - 4095). This module is a 12-bit precision DAC module, hence the values ranging fro
     * @param channel Output Channel
     * @n 0:Channel 0

FAQ

RESULT

After downloading the program, the measured output voltage of channel 0 under the 0-2.5V state is 1.62V, and the output voltage of channel 1 is 0.668V. Under the 0-VCC state, the actual output voltage of channel 0 is 3.23V, and the output voltage of channel 1 is 1.334V.
