1 i.MX 8M Plus introduction

The i.MX 8M Plus family focuses on neural processing unit (NPU) and vision system, advance multimedia, and industrial automation with high reliability.

The i.MX 8M Plus is a powerful quad Arm® Cortex®-A53 processor with speed up to 1.8 GHz integrated with a NPU of 2.3 TOPS that greatly accelerate machine learning inference. The vision engine is composed of two camera inputs and a HDR-capable Image Signal Processor (ISP) capable of 375 MPixels/s.

The advanced multimedia capabilities include 1080p60 video encode and decode H.265 and H.264. A 3D and 2D graphic acceleration supporting 1 GPixel/s, OpenVG 1.1, Open GL ES3.1, Vulkan, and Open CL 1.2 FP. Multiple audio and microphone interfaces for Immersive Audio and Voice systems.

For industrial applications, real time control is enabled by an integrated 800 MHz Arm® Cortex®-M7. Robust control networks are possible via CAN-FD interfaces. And a dual Gb Ethernet, one supporting Time Sensitive Networking (TSN), drive gateway applications with low latency. High industrial system reliability for safety is leveraged by DRAM Inline ECC as well as ECC support on internal software-accessible SRAMs.

i.MX 8M Plus introduction

The i.MX 8M Plus is very versatile presenting multiple displays and high-speed interfaces as well as multiple memory interfaces.

It is built to meet the needs for Smart Home, Building, City and Industry 4.0 applications.

2 Modules list

The i.MX 8M Plus family of processors contains a variety of digital and analog modules. [Table 4](#) describes these modules in alphabetical order.

Table 4. i.MX 8M Plus modules list

Block mnemonic	Block name	Brief description
APBH-DMA	NAND Flash and BCH ECC DMA Controller	DMA controller used for GPMI2 operation.
Arm	Arm Platform	The Arm Core Platform includes a quad Cortex-A53 core and a Cortex-M7 core. The Cortex-A53 core includes associated sub-blocks, such as the Level 2 Cache Controller, Snoop Control Unit (SCU), General Interrupt Controller (GIC), private timers, watchdog, and CoreSight debug modules. The Cortex-M7 core is used as a customer microcontroller.
ASRC	Asynchronous Sample Rate Converter	The Asynchronous Sample Rate Converter (ASRC) can process 4 groups of audio channels with an independent time-base simultaneously. A group of channels with the same time-base (or resampling ration) is referred to as a context. Each context has independent processing pipelines. Contexts can be configured to start and stop at any time without affecting the processing of other contexts. The ASRC supports up to 32 audio channels, which can either be assigned to a single context or spread across multiple contexts.
BCH	Binary-BCH ECC Processor	The BCH module provides up to 62-bit ECC encoder/decoder for NAND Flash controller (GPMI).
CAAM	Cryptographic accelerator and assurance module	CAAM is a cryptographic accelerator and assurance module. CAAM implements several encryption and hashing functions, a run-time integrity checker, entropy source generator, and a Pseudo Random Number Generator (PRNG). The PRNG is certifiable by the Cryptographic Algorithm Validation Program (CAVP) of the National Institute of Standards and Technology (NIST). CAAM also implements a Secure Memory mechanism. In i.MX 8M Plus processors, the secure memory provided is 32 KB.
CCM GPC SRC	Clock Control Module, General Power Controller, System Reset Controller	These modules are responsible for clock and reset distribution in the system, and also for the system power management.
CSU	Central Security Unit	The Central Security Unit (CSU) is responsible for setting comprehensive security policy within the i.MX 8M Plus platform.
CTI-0 CTI-1 CTI-2 CTI-3 CTI-4	Cross Trigger Interface	Cross Trigger Interface (CTI) allows cross-triggering based on inputs from masters attached to CTIs. The CTI module is internal to the Cortex-A53 core platform.
DAP	Debug Access Port	The DAP provides real-time access for the debugger without halting the core to access: <ul style="list-style-type: none"> • System memory and peripheral registers • All debug configuration registers The DAP also provides debugger access to JTAG scan chains.

Table 4. i.MX 8M Plus modules list (continued)

Block mnemonic	Block name	Brief description
DDRC	Double Data Rate Controller	The DDR Controller has the following features: <ul style="list-style-type: none"> • Supports 32-bit LPDDR4-4000 and DDR4-3200 • Supports up to 8 Gbyte DDR memory space
eCSPI1 eCSPI2 eCSPI3	Configurable SPI	Full-duplex enhanced Synchronous Serial Interface, with data rate up to 52 Mbit/s. Configurable to support Master/Slave modes.
eDMA	Enhanced Direct Memory Access	<ul style="list-style-type: none"> • There is one enhanced DMAs (eDMA). • The eDMA is a 32-channel DMA engine • It is provided specifically for copying between memory and memory (most likely such as between two of DRAM, OCRAM_A, and Audio DSPs TCM). • It separates the 32 channels into separate 64 KByte regions in the system memory map for virtualization and partitioning purpose. • There are no DMA requests connected to eDMA from any peripheral. It is generally controlled by the Audio DSP (or potentially the Cortex-A53 or Cortex_M7).
ENET	Ethernet Controller	The Ethernet Media Access Controller (MAC) is designed to support 10/100/1000 Mbps Ethernet/IEEE 802.3 networks. An external transceiver interface and transceiver function are required to complete the interface to the media. The module has dedicated hardware to support the IEEE 1588 standard. See the ENET chapter of the <i>i.MX 8M Plus Applications Processor Reference Manual (IMX8MPRM)</i> for details.
ENET_QOS	Ethernet QoS Controller	The ENET_QOS is compliant with the IEEE 802.3–2015 specification and can be used in applications, such as AV bridges, AV nodes, switches, data center bridges and nodes, and network interface cards. It enables a host to transmit and receive data over Ethernet in compliance with the IEEE802.3–2015. A separate 1 Gbit Ethernet QoS with TSN supports the same features as ENET and also following features: <ul style="list-style-type: none"> • 802.1Qbv Enhancements to Scheduling Traffic • 802.1Qbu Frame preemption • Time Based Scheduling
FlexCAN1 FlexCAN2	Flexible Controller Area Network	Communication controller implementing the CAN protocol according to the CAN 2.0B protocol specification.
FlexSPI	FlexSPI	The FlexSPI module acts as an interface to external serial flash devices. This module contains the following features: <ul style="list-style-type: none"> • Flexible sequence engine to support various flash vendor devices • Single pad/Dual pad/Quad pad mode of operation • Single Data Rate/Double Data Rate mode of operation • Parallel Flash mode • DMA support • Memory mapped read access to connected flash devices • Multi master access with priority and flexible and configurable buffer for each master
GIC	Generic Interrupt Controller	The GIC handles all interrupts from the various subsystems and is ready for virtualization.

Table 4. i.MX 8M Plus modules list (continued)

Block mnemonic	Block name	Brief description
GPIO1 GPIO2 GPIO3 GPIO4 GPIO5	General Purpose I/O Modules	Used for general purpose input/output to external ICs. Each GPIO module supports up to 32 bits of I/O.
GPMI	General Purpose Memory Interface	The GPMI module supports up to 4x NAND devices and 62-bit ECC encryption/decryption for NAND Flash Controller (GPMI2). GPMI supports separate DMA channels for each NAND device.
GPT1 GPT2 GPT3 GPT4 GPT5 GPT6	General Purpose Timer	Each GPT is a 32-bit “free-running” or “set-and-forget” mode timer with programmable prescaler and compare and capture register. A timer counter value can be captured using an external event and can be configured to trigger a capture event on either the leading or trailing edges of an input pulse. When the timer is configured to operate in “set-and-forget” mode, it is capable of providing precise interrupts at regular intervals with minimal processor intervention. The counter has output compare logic to provide the status and interrupt at comparison. This timer can be configured to run either on an external clock or on an internal clock.
GPU2D	Graphics Processing Unit-2D	This Graphic Processing Unit defines a high-performance, multi-pipe 2D raster graphics core that accelerates the 2D graphics display.
GPU3D	Graphics Processing Unit-3D	The GPU3D provides hardware acceleration for 3D graphics algorithms with sufficient processor power to run desktop quality interactive graphics applications on displays.
I2C1 I2C2 I2C3 I2C4 I2C5 I2C6	I ² C Interface	I ² C provides serial interface for external devices. Data rates of up to 320 kbps are supported.
IOMUXC	IOMUX Control	This module enables flexible I/O multiplexing. Each IO pad has a default as well as several alternate functions. The alternate functions are software configurable.
LCDIF	LCD interface	The LCD Interface (LCDIF) is a general purpose display controller used to drive a wide range of display devices varying in size and capability.
LDB	LVDS Display Bridge	LVDS Display Bridge is used to connect the LCDIF to External LVDS Display Interface. LDB supports two channels; each channel has following signals: <ul style="list-style-type: none"> • One clock pair • Four data pairs Each signal pair contains LVDS special differential pad (PadP, PadM).
MIPI CSI1 MIPI CSI2 (four-lane)	MIPI Camera Serial Interface	This module provides one four-lane MIPI camera serial interfaces, which operates up to a maximum bit rate of 1.5 Gbps.
MIPI DSI (four-lane)	MIPI Display Serial Interface	This module provides a four-lane MIPI display serial interface operating up to a maximum bit rate of 1.5 Gbps.

Table 4. i.MX 8M Plus modules list (continued)

Block mnemonic	Block name	Brief description
OCOTP_CTRL	OTP Controller	The On-Chip OTP controller (OCOTP_CTRL) provides an interface for reading, programming, and/or overriding identification and control information stored in on-chip fuse elements. The module supports electrically programmable poly fuses (eFUSES). The OCOTP_CTRL also provides a set of volatile software-accessible signals that can be used for software control of hardware elements, not requiring non volatility. The OCOTP_CTRL provides the primary user-visible mechanism for interfacing with on-chip fuse elements. Among the uses for the fuses are unique chip identifiers, mask revision numbers, cryptographic keys, JTAG secure mode, boot characteristics, and various control signals requiring permanent non volatility.
OCRAM	On-Chip Memory controller	The On-Chip Memory controller (OCRAM) module is designed as an interface between the system's AXI bus and the internal (on-chip) SRAM memory module. In i.MX 8M Plus processors, the OCRAM is used for controlling the 868KB multimedia RAM through AXI bus.
PCIe	PCI Express 3.0	The PCIe IP provides PCI Express Gen 3 functionality.
PMU	Power Management Unit	Integrated power management unit. Used to provide power to various SoC domains.
PWM1 PWM2 PWM3 PWM4	Pulse Width Modulation	The pulse-width modulator (PWM) has a 16-bit counter and is optimized to generate sound from stored sample audio images. It can also generate tones. It uses 16-bit resolution and a 4x16 data FIFO to generate sound.
SAI1 SAI2 SAI3 SAI5 SAI6 SAI7	Synchronous Audio Interface	The SAI module provides a synchronous audio interface (SAI) that supports full duplex serial interfaces with frame synchronization, such as I2S, AC97, TDM, and codec/DSP interfaces.

Table 4. i.MX 8M Plus modules list (continued)

Block mnemonic	Block name	Brief description
SDMA	Smart Direct Memory Access	<p>The SDMA is a multichannel flexible DMA engine. It helps in maximizing system performance by offloading the various cores in dynamic data routing. It has the following features:</p> <ul style="list-style-type: none"> • Powered by a 16-bit Instruction-Set micro-RISC engine • Multi channel DMA supporting up to 32 time-division multiplexed DMA channels • 48 events with total flexibility to trigger any combination of channels • Memory accesses including linear, FIFO, and 2D addressing • Shared peripherals between Arm and SDMA • Very fast Context-Switching with 2-level priority based preemptive multi tasking • DMA units with auto-flush and prefetch capability • Flexible address management for DMA transfers (increment, decrement, and no address changes on source and destination address) • DMA ports can handle unidirectional and bidirectional flows (Copy mode) • Up to 8-word buffer for configurable burst transfers for EMIv2.5 • Support of byte-swapping and CRC calculations • Library of Scripts and API is available
SJC	Secure JTAG Controller	<p>The SJC provides JTAG interface (designed to be compatible with JTAG TAP standards) to internal logic. The i.MX 8M Plus family of processors uses JTAG port for production, testing, and system debugging. Additionally, the SJC provides BSR (Boundary Scan Register) standard support, designed to be compatible with IEEE 1149.1 and IEEE 1149.6 standards.</p> <p>The JTAG port must be accessible during platform initial laboratory bring-up, for manufacturing tests and troubleshooting, as well as for software debugging by authorized entities. The i.MX 8M Plus SJC incorporates three security modes for protecting against unauthorized accesses. Modes are selected through eFUSE configuration.</p>
SNVS	Secure Non-Volatile Storage	Secure Non-Volatile Storage, including Secure Real Time Clock, Security State Machine, Master Key Control, and Violation Detection and reporting.
SPDIF1	Sony Philips Digital Interconnect Format	A standard audio file transfer format, developed jointly by the Sony and Phillips corporations. It supports Transmitter and Receiver functionality.
System Bus (NoC)	Network-on-Chip	<p>The module is used as central inter-connect fabric, which runs at approximately 1/4 of the DRAM data rate, and links the bus master to DRAM controller for high-throughput DRAM access.</p> <p>Multiple additional NoCs as the high-performance inter-connect bus fabric for high-speed initiators.</p>
TEMPSENSOR	Temperature Sensor	Temperature sensor
TZASC	Trust-Zone Address Space Controller	The TZASC (TZC-380 by Arm) provides security address region control functions required for intended application. It is used on the path to the DRAM controller.

Table 4. i.MX 8M Plus modules list (continued)

Block mnemonic	Block name	Brief description
UART1 UART2 UART3 UART4	UART Interface	Each of the UARTv2 modules supports the following serial data transmit/receive protocols and configurations: <ul style="list-style-type: none"> • 7- or 8-bit data words, 1 or 2 stop bits, programmable parity (even, odd, or none) • Programmable baud rates up to 4 Mbps. This is a higher max baud rate relative to the 1.875 MHz, which is stated by the TIA/EIA-232-F standard. • 32-byte FIFO on Tx and 32 half-word FIFO on Rx supporting auto-baud
uSDHC1 uSDHC2 uSDHC3	SD/MMC and SDXC Enhanced Multi-Media Card / Secure Digital Host Controller	i.MX 8M Plus SoC characteristics: All the MMC/SD/SDIO controller IPs are based on the uSDHC IP. They are designed to support: <ul style="list-style-type: none"> • SD/SDIO standard, up to version 3.0. • MMC standard, up to version 5.1. • 1.8 V and 3.3 V operation, but do not support 1.2 V operation. • 1-bit/4-bit SD and SDIO modes, 1-bit/4-bit/8-bit MMC mode.
USB 3.0	2x USB 3.0 controllers and PHYs	Two USB controllers and PHYs that support USB 3.0. Each USB instance contains: <ul style="list-style-type: none"> • USB 3.0 core, which can operate in 2.0 mode
VPU	Video Processing Unit	A high performing video processing unit (VPU), which covers many SD-level and HD-level video decoders. See the <i>i.MX 8M Plus Applications Processor Reference Manual</i> (IMX8MPRM) for a complete list of the VPU's decoding and encoding capabilities.
WDOG1 WDOG2 WDOG3	Watchdog	The watchdog (WDOG) timer supports two comparison points during each counting period. Each of the comparison points is configurable to evoke an interrupt to the Arm core, and a second point evokes an external event on the WDOG line.
XTALOSC	Crystal Oscillator interface	The XTALOSC module enables connectivity to an external crystal oscillator device. In a typical application use case, it is used for a 24 MHz oscillator.

3.1.2 Thermal resistance

3.1.2.1 15 x 15 mm FCPBGA package thermal characteristics

Table 11 displays the 15 x 15 mm FCPBGA package thermal resistance data.

Table 11. 15 x 15 mm FCPBGA thermal resistance data

Rating ¹	Board Type ²	Symbol	Value	Unit
Junction to Ambient Thermal Resistance ³	JESD51-9, 2s2p	$R_{\theta JA}$	21.1	°C/W
Junction-to-Top of Package Thermal Characterization parameter ³	JESD51-9, 2s2p	Ψ_{JT}	0.98	°C/W
Junction to Case Thermal Resistance ⁴	JESD51-9, 1s	$R_{\theta JC}$	0.24	°C/W

¹ The ratings were generated using a non-uniformly powered die.

² Thermal test board meets JEDEC specification for this package (JESD51-9). PCB has no thermal vias under the package.

³ Determined in accordance to JEDEC JESD51-2A natural convection environment. Thermal resistance data in this report is solely for a thermal performance comparison of one package to another in a standardized specified environment. It is not meant to predict the performance of a package in an application-specific environment.

⁴ Junction-to-Case thermal resistance determined using an isothermal cold plate. Case temperature refers to the package top side surface.

3.1.3 Power architecture

The power architecture of the chip is defined based on the assumption that lowest-cost system are constructed for case where the PMIC is always used to supply all the power rails to the processor.

The digital logic inside chip will be supplied with two supplies: VDD_ARM and VDD_SOC.

- VDD_ARM is for the Cortex®-A53 platform.
- VDD_SOC is for the rest of the modules in SoC.

The VDD_SOC can be nominal or overdrive voltage, the VDD_ARM can be nominal, overdrive or super-overdrive. To support system with VDD_ARM at super-overdrive voltage, it is recommended to use two external DCDC or DC-DC supplies, first one for VDD_ARM and the second one for VDD_SOC. However, for cost-optimized solutions, the two supplies can be tied together in customer systems. VDD_ARM can support DVFS for SoCs that choose to enable it. VDD_SOC does not support fast on-the-fly DVFS, but can support mode-based dynamic voltage for SoCs that choose to enable it.

The GPIO pads will have external power supply for 3.3 V and 1.8 V IO voltage. The IO pad core voltage will be supplied directly by VDD_SOC. For 3.3 V IO pad, its 3.3 V IO supply (NVCC) and 1.8 V pre-driver supply (PVCC_1P8) should be always meet $NVCC - PVCC < 2$ V requirement during power up and power down. For 1.8 V IO pad, its 1.8 V PVCC can be shorted together with NVCC.

The DRAM controller and PHY have four external power supplies: VDD_SOC supplies controller and PHY digital logic, VDD_DRAM_PLL_1P8 / VDD_DRAM_PLL_0P8 for PHY analog circuit, and NVCC_DRAM for IO.

For all the integrated analog modules, their 1.8 V analog power and 0.85 V/0.95 V digital power will be supplied externally through power pads. These supplies are separated with other power pads on the

package to keep them clean, but they can be directly shared with other power rails on the board to reduce the number of power supplies from the PMIC.

For all the integrated PCIe PHY, LVDS PHY, MIPI PHY, and USB PHY, their 3.3 V (where supported), 1.8 V and 0.85/0.95 V power will be supplied externally through power pads. The powers to those PHYs are separated with other power pads on the package to keep them clean, but they can be directly shared with other power rails on the board to reduce the number of power supplies from the PMIC. A LDO will be integrated to generate the 1.2 V required for the MIPI PHY. The MIPI PHY also has integrated within its PHY and LDO to generate its 0.4V supply. External capacitors are required for both the 1.2 V and 0.4 V internal LDO regulators.

For SNVS/RTC, the 1.8 V IO pre-driver supply and 1.8 V IO pad supply will also be supplied externally. The 0.8 V SNVS_LP core domain logic is supplied by an internal LDO.

[Figure 3](#) is the power architecture diagram. Note it only shows supplies, and does not show capacitors that may be required for internal LDO regulators.

¹ Applying the maximum voltage results in maximum power consumption and heat generation. A voltage set point = (V_{min} + the supply tolerance) is recommended. This results in an optimized power/speed ratio.

² Overdrive maximum voltage includes all the nominal frequencies.

³ For VDD_ARM at 1.0 V typical, Power-on Hours will decrease if junction temperature is increased. Please see the *i.MX 8M Plus Lifetime Application Note* for more details.

3.1.6 External clock sources

Each i.MX 8M Plus processor has two external input system clocks: a low frequency (RTC_XTALI) and a high frequency (XTALI).

The system clock input XTALI is used to generate the main system clock. It supplies the PLLs and other peripherals. The system clock input can be connected to either an external oscillator or a crystal using internal oscillator amplifier.

Table 14 shows the interface frequency requirements.

Table 14. External input clock frequency

Parameter Description	Symbol	Min	Typ	Max	Unit
RTC_XTALI Oscillator ^{1,2}	f_{ckil}	—	32.768 ³	—	kHz
XTALI Oscillator ^{2,4}	f_{xtal}	—	24	—	MHz

¹ External oscillator or a crystal with internal oscillator amplifier.

² The required frequency stability of this clock source is application dependent.

³ Recommended nominal frequency 32.768 kHz.

⁴ External oscillator or a fundamental frequency crystal appropriately coupled to the internal oscillator amplifier.

The typical values shown in Table 14 are required for use with NXP software to ensure precise time keeping and USB operation.

When connecting external input clock to OSC32K, following connections are recommended:

- 1.8 V square waveform to RTC_XTALI

- RTC_XTALO is connected to NVCC_SNV5_1P8 (1.8 V) through a 100 Kohm resistor.

i.MX 8M Plus has an integrated ring oscillator that allows the system to have an immediate clock. This clock automatically switches to OSC32K XTAL when available. Additionally, if the clock monitor determines that the OSC32K oscillation is not present, then the source of the 32 kHz clock will automatically switch to the internal ring oscillator of lesser frequency accuracy.

CAUTION

The internal ring oscillator is not meant to be used in customer applications, due to gross frequency variation over wafer processing, temperature, and supply voltage. These variations will cause timing issues to many different circuits that use the internal ring oscillator for reference; and, if this timing is critical, application issues will occur. To prevent application issues, it is recommended to only use an external crystal or an accurate external clock. If this recommendation is not followed, NXP cannot guarantee full compliance of any circuit using this clock.

Table 15 shows the external input clock for OSC32K.

Table 15. External input clock for OSC32K

	I _{IH}	-12	—	12	μA
	I _{IL}	-12	—	12	μA

When connecting to 24 MHz clock, following connections are recommended:

- 1.8 V square waveform to XTALI_24M
- XTALO_24M is connected to VDD_24M_XTAL_1P8 through a 400 ohm resistor.

Table 16 shows the external input clock for 24 MHz.

3.1.7 Estimated power supply maximum currents

Power consumption is highly dependent on the application. The table below represents the estimated maximum current on the power supply rails and should be used as a guideline for power supply selection. The data below is based on a combination of design simulation and characterization data based on typical datasheet voltages. Actual power consumption for typical use cases are lower than values presented on the table below.

3.1.8 Power modes

The i.MX 8M Plus supports the following power modes:

- RUN Mode: All external power rails are on, CPU is active and running; other internal modules can be on/off based on application.
- IDLE Mode: When there is no thread running and all high-speed devices are not active, the CPU can automatically enter this mode. The CPU can be in the power-gated state but with L2 data retained, DRAM and the bus clock are reduced. Most of the internal logic is clock gated but still remains powered. The M7 core can remain running. Compared with RUN mode, all the external power rails from the PMIC remain the same, and most of the modules still remain in their state.

- SUSPEND Mode: The most efficient power saving mode where all the clocks are off and all the unnecessary power supplies are off.
- SNVS Mode: This mode is also called RTC mode. Only the power for the SNVS domain remains on to keep RTC and SNVS logic alive.
- OFF Mode: All power rails are off.

3.2 Power supplies requirements and restrictions

The system design must comply with power-up sequence, power-down sequence, and steady state guidelines as described in this section to guarantee the reliable operation of the device. Any deviation from these sequences may result in the following situations:

- Excessive current during power-up phase
- Prevention of the device from booting
- Irreversible damage to the processor (worst-case scenario)

3.2.1 Power-up sequence

Figure 5 illustrates the power-up sequence of i.MX 8M Plus processor.

3.4 I/O DC parameters

This section includes the DC parameters of the following I/O types:

- General Purpose I/O (GPIO)
- Double Data Rate I/O (DDR) for LPDDR4 and DDR4 modes
- LVDS I/O

3.4.1 General purpose I/O (GPIO) DC parameters

Table 26 shows DC parameters for GPIO pads. The parameters in Table 26 are guaranteed per the operating ranges in Table 12, unless otherwise noted.

3.4.2 DDR I/O DC electrical characteristics

The DDR I/O pads support LPDDR 4 and DDR4 operational modes. The DDR Memory Controller (DDRMC) is compliant with JEDEC-compliant SDRAMs.

DDRMC operation is contingent upon the board’s DDR design adherence to the DDR design and layout requirements stated in the hardware development guide for the i.MX 8M Plus application processor.

3.4.3 LVDS I/O DC parameters

The LVDS interface complies with TIA/EIA 644-A standard. See TIA/EIA STANDARD 644-A, “Electrical Characteristics of Low Voltage Differential Signaling (LVDS) Interface Circuits” for details.

Table 28 shows the Low Voltage Differential Signaling (LVDS) I/O DC parameters.

3.5 I/O AC parameters

This section includes the AC parameters of the following I/O types:

- General Purpose I/O (GPIO)
- Double Data Rate I/O (DDR) for LPDDR4 and DDR4 modes
- LVDS I/O

The GPIO and DDR I/O load circuit and output transition time waveforms are shown in Figure 7 and Figure 8.

¹ $t_{SKD} = |t_{PHLD} - t_{PLHD}|$, is the magnitude difference in differential propagation delay time between the positive going edge and the negative going edge of the same channel.

² Measurement levels are 20–80% from output voltage.

3.6 Output buffer impedance parameters

This section defines the I/O impedance parameters of the i.MX 8M Plus family of processors for the following I/O types:

- Differential I/O (CCM_CLK1)
- Double Data Rate I/O (DDR) for LPDDR4 and DDR4 modes

NOTE

DDR I/O output driver impedance is measured with “long” transmission line of impedance Z_{tl} attached to I/O pad and incident wave launched into transmission line. R_{pu}/R_{pd} and Z_{tl} form a voltage divider that defines specific voltage of incident wave relative to OVDD. Output driver impedance is calculated from this voltage divider (see Figure 10).

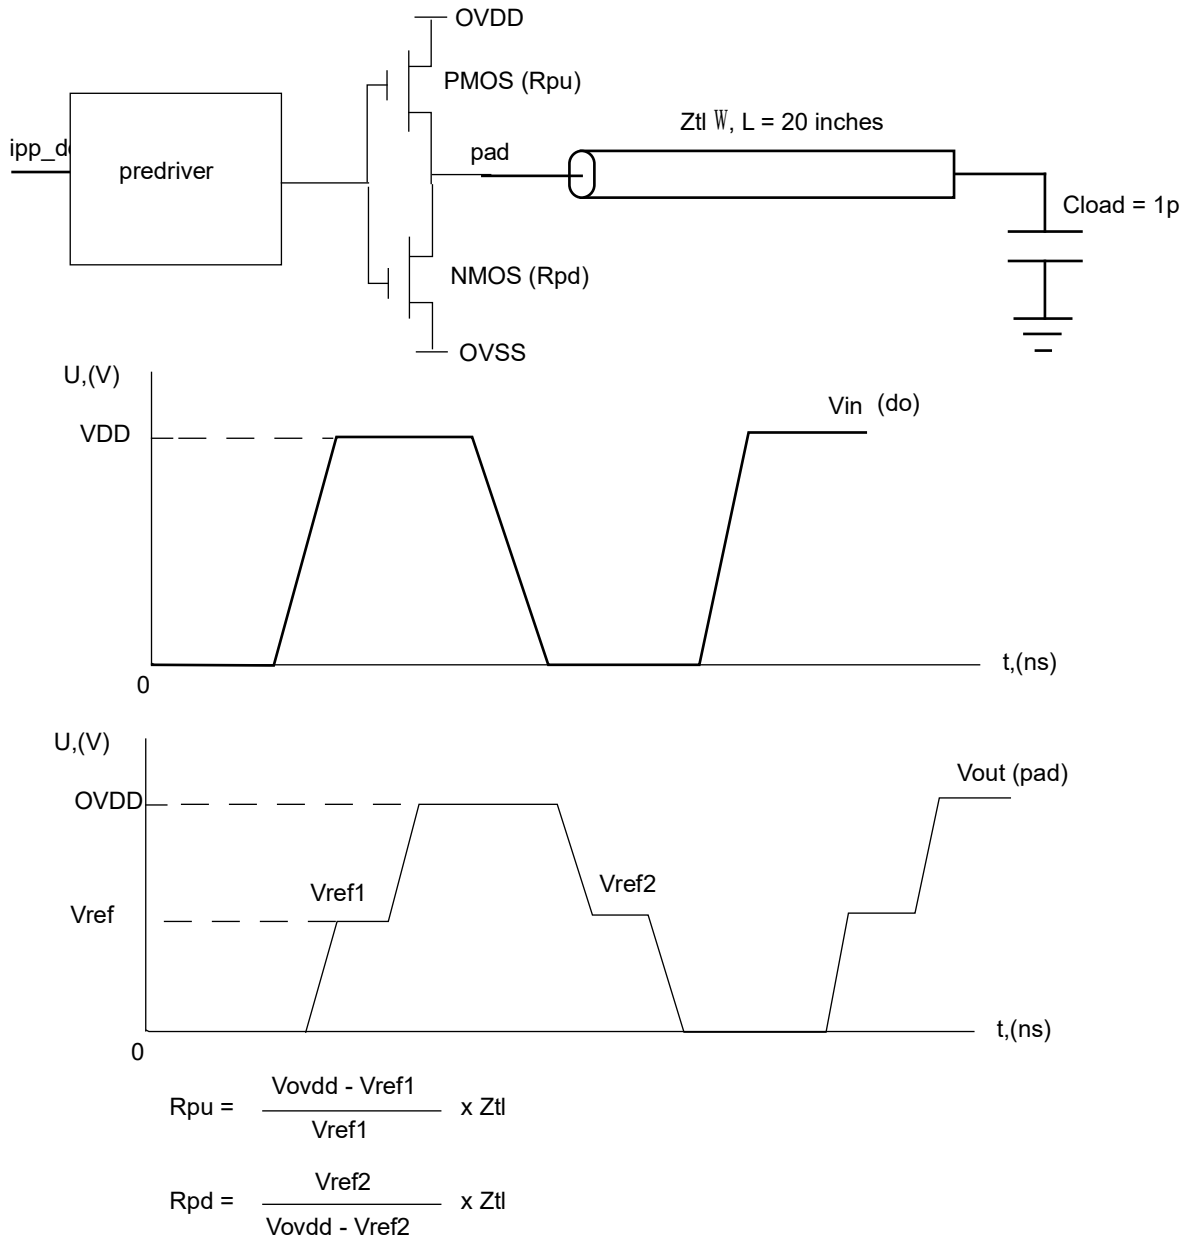

Figure 10. Impedance matching load for measurement

3.6.1 Differential I/O output buffer impedance

The Differential CCM interface is designed to be compatible with TIA/EIA 644-A standard. See, TIA/EIA STANDARD 644-A, *Electrical Characteristics of Low Voltage Differential Signaling (LVDS) Interface Circuits* (2001) for details.

3.6.2 DDR I/O output buffer impedance

¹ Output driver impedance is controlled across PVTs using ZQ calibration procedure.

² Calibration is done against 240 Ω external reference resistor.

³ Output driver impedance deviation (calibration accuracy) is ±5% (max/min impedance) across PVTs.

⁴ Output driver impedance values are included in the IBIS model.

3.7 System modules timing

This section contains the timing and electrical parameters for the modules in each i.MX 8M Plus processor.

3.7.1 Reset timings parameters

Figure 11 shows the reset timing and Table 33 lists the timing parameters.

NOTE

RTC_XTALI is approximately 32 kHz. RTC_XTALI cycle is one period or approximately 30 μ s.

NOTE

WDOGx_B output signals (for each one of the Watchdog modules) do not have dedicated pins, but are muxed out through the IOMUX. See the IOMUXC chapter of the *i.MX 8M Plus Applications Processor Reference Manual* (IMX8MPRM) for detailed information.

3.7.3 DDR SDRAM–specific parameters (LPDDR4 and DDR4)

The i.MX 8M Plus Family of processors have been designed and tested to work with JEDEC JESD209-4A–compliant LPDDR4 memory and JESD79-4A compliant DDR4 memory. Timing diagrams

and tolerances required to work with these memories are specified in the respective documents and are not reprinted here.

Meeting the necessary timing requirements for a DDR memory system is highly dependent on the components chosen and the design layout of the system as a whole. NXP cannot cover in this document all the requirements needed to achieve a design that meets full system performance over temperature, voltage, and part variation; PCB trace routing, PCB dielectric material, number of routing layers used, placement of bulk/decoupling capacitors on critical power rails, VIA placement, GND and Supply planes layout, and DDR controller/PHY register settings all are factors affecting the performance of the memory system. Consult the hardware user guide for this device and NXP validated design layouts for information on how to properly design a PCB for best DDR performance. NXP strongly recommends duplicating an NXP validated design as much as possible in the design of critical power rails, placement of bulk/decoupling capacitors and DDR trace routing between the processor and the selected DDR memory. All supporting material is readily available on the device web page on <https://www.nxp.com/products/processors-and-microcontrollers/applications-processors/i.mx-applications-processors/i.mx-8-processors:IMX8-SERIES>.

Processors that demonstrate full DDR performance on NXP validated designs, but do not function on customer designs, are not considered marginal parts. A report detailing how the returned part behaved on an NXP validated system will be provided to the customer as closure to a customer's reported DDR issue. Customers bear the responsibility of properly designing the Printed Circuit Board, correctly simulating and modeling the designed DDR system, and validating the system under all expected operating conditions (temperatures, voltages) prior to releasing their product to market.

These processors uses generic names for clock, data, and command address bus (DCF—DRAM controller functions); see [Table 79](#) for details about mapping of clock, data, and command address signals of LPDDR4 and DDR4 modes.

3.8 External peripheral interface parameters

The following subsections provide information on external peripheral interfaces.

3.8.1 ECSPI timing parameters

This section describes the timing parameters of the ECSPI blocks. The ECSPI have separate timing parameters for master and slave modes.

3.8.1.1 ECSPI Master mode timing

Figure 13 depicts the timing of ECSPI in master mode. Table 36 lists the ECSPI master mode timing characteristics.

¹ In Low-Speed mode, card clock must be lower than 400 kHz, voltage ranges from 2.7 to 3.6 V.

² In Normal (Full) -Speed mode for SD/SDIO card, clock frequency can be any value between 0 – 25 MHz. In High-speed mode, clock frequency can be any value between 0 – 50 MHz.

³ In Normal (Full) -Speed mode for MMC card, clock frequency can be any value between 0 – 20 MHz. In High-speed mode, clock frequency can be any value between 0 – 52 MHz.

⁴ To satisfy hold timing, the delay difference between clock input and cmd/data input must not exceed 2 ns.

3.8.2.2 eMMC5.1/SD3.0 (dual data rate) AC timing

Figure 16 depicts the timing of eMMC5.1/SD3.0 (DDR). Table 40 lists the eMMC5.1/SD3.0 (DDR) timing characteristics. Be aware that only DATA is sampled on both edges of the clock (not applicable to CMD).

3.8.2.6 Bus operation condition for 3.3 V and 1.8 V signaling

Signaling level of SD/eMMC4.5/5.0/5.1 can be 1.8 V or 3.3 V depending on the working mode. The DC parameters for the NVCC_SD1, NVCC_SD2, and NVCC_SD3 supplies are identical to those shown in Table 26, "GPIO DC parameters," on page 38.

3.8.3 Ethernet controller (ENET) AC electrical specifications

Ethernet supports the following key features:

- Support ENET AVB
- Support IEEE 1588
- Support Energy Efficient Ethernet (EEE)
- 1.8 V/3.3 V RMI operation, 1.8 V RGMII operation

The following sections introduce the ENET AC electrical specifications.

3.8.3.1 ENET1 signal mapping

The following timing specs are defined at the chip I/O pin and must be translated appropriately to arrive at timing specs/constraints for the physical interface.

3.8.3.3 RGMII signal switching specifications

The following timing specifications meet the requirements for RGMII interfaces for a range of transceiver devices.

Table 46. RGMII signal switching specifications¹

Symbol	Description	Min.	Max.	Unit
T_{cyc}^2	Clock cycle duration	7.2	8.8	ns
T_{skewT}^3	Data to clock output skew at transmitter	-500	500	ps
T_{skewR}^3	Data to clock input skew at receiver	1	2.6	ns
Duty_G ⁴	Duty cycle for Gigabit	45	55	%
Duty_T ⁴	Duty cycle for 10/100T	40	60	%
Tr/Tf	Rise/fall time (20–80%)	—	0.75	ns

¹ The timings assume the following configuration:

DDR_SEL = (11)b

DSE (drive-strength) = (111)b

² For 10 Mbps and 100 Mbps, T_{cyc} will scale to 400 ns ±40 ns and 40 ns ±4 ns respectively.

³ For all versions of RGMII prior to 2.0; this implies that PC board design will require clocks to be routed such that an additional trace delay of greater than 1.5 ns and less than 2.0 ns will be added to the associated clock signal. For 10/100, the Max value is unspecified.

⁴ Duty cycle may be stretched/shrunk during speed changes or while transitioning to a received packet's clock domain as long as minimum duty cycle is not violated and stretching occurs for no more than three T_{cyc} of the lowest speed transitioned between.

3.8.4.3 RGMII signal switching specifications

The following timing specifications meet the requirements for RGMII interfaces for a range of transceiver devices.

Table 49. RGMII signal switching specifications¹

Symbol	Description	Min.	Max.	Unit
T_{cyc}^2	Clock cycle duration	7.2	8.8	ns
T_{skewT}^3	Data to clock output skew at transmitter	-500	500	ps
T_{skewR}^3	Data to clock input skew at receiver	1	2.6	ns
Duty_G ⁴	Duty cycle for Gigabit	45	55	%
Duty_T ⁴	Duty cycle for 10/100T	40	60	%
Tr/Tf	Rise/fall time (20–80%)	—	0.75	ns

¹ The timings assume the following configuration:

DDR_SEL = (11)b

DSE (drive-strength) = (111)b

² For 10 Mbps and 100 Mbps, T_{cyc} will scale to 400 ns ±40 ns and 40 ns ±4 ns respectively.

³ For all versions of RGMII prior to 2.0; this implies that PC board design will require clocks to be routed such that an additional trace delay of greater than 1.5 ns and less than 2.0 ns will be added to the associated clock signal. For 10/100, the Max value is unspecified.

⁴ Duty cycle may be stretched/shrunk during speed changes or while transitioning to a received packet's clock domain as long as minimum duty cycle is not violated and stretching occurs for no more than three T_{cyc} of the lowest speed transitioned between.

3.8.5 General-purpose media interface (GPMI) timing

The i.MX 8M Plus GPMI controller is a flexible interface NAND Flash controller with 8-bit data width, up to 200 MB/s I/O speed and individual chip select.

It supports Asynchronous Timing mode, Source Synchronous Timing mode and Toggle Timing mode separately, as described in the following subsections.

3.8.5.1 Asynchronous mode AC timing (ONFI 1.0 compatible)

Asynchronous mode AC timings are provided as multiplications of the clock cycle and fixed delay. The maximum I/O speed of GPMI in Asynchronous mode is about 50 MB/s. Figure 27 through Figure 30 depicts the relative timing between GPMI signals at the module level for different operations under Asynchronous mode. Table 50 describes the timing parameters (NF1–NF17) that are shown in the figures.

¹ GPMI's Asynchronous mode output timing can be controlled by the module's internal registers HW_GPMI_TIMING0_ADDRESS_SETUP, HW_GPMI_TIMING0_DATA_SETUP, and HW_GPMI_TIMING0_DATA_HOLD. This AC timing depends on these registers settings. In the table, AS/DS/DH represents each of these settings.

² AS minimum value can be 0, while DS/DH minimum value is 1.

³ T = GPMI clock period -0.075 ns (half of maximum p-p jitter).

⁴ NF12 is guaranteed by the design.

⁵ Non-EDO mode.

⁶ EDO mode, GPMI clock ≈ 100 MHz
(AS=DS=DH=1, GPMI_CTL1 [RDN_DELAY] = 8, GPMI_CTL1 [HALF_PERIOD] = 0).

In EDO mode (Figure 30), NF16/NF17 are different from the definition in non-EDO mode (Figure 29). They are called tREA/tRHOH (RE# access time/RE# HIGH to output hold). The typical values for them are 16 ns (max for tREA)/15 ns (min for tRHOH) at 50 MB/s EDO mode. In EDO mode, GPMI samples NAND_DATAxx at the rising edge of delayed NAND_RE_B provided by an internal DPLL. The delay value can be controlled by GPMI_CTRL1.RDN_DELAY (see the GPMI chapter of the *i.MX 8M Plus Applications Processor Reference Manual* [IMX8MPRM]). The typical value of this control register is 0x8 at 50 MT/s EDO mode. But if the board delay is big enough and cannot be ignored, the delay value should be made larger to compensate the board delay.

3.8.5.2 Source synchronous mode AC timing (ONFI 2.x compatible)

¹ GPMI's Source Synchronous mode output timing can be controlled by the module's internal registers GPMI_TIMING2_CE_DELAY, GPMI_TIMING2_PREAMBLE_DELAY, GPMI_TIMING2_POST_DELAY. This AC timing depends on these registers settings. In the table, CE_DELAY/PRE_DELAY/POST_DELAY represents each of these settings.

² T = tCK(GPMI clock period) - 0.075 ns (half of maximum p-p jitter).

For DDR Source Synchronous mode, Figure 35 shows the timing diagram of NAND_DQS/NAND_DATAxx read valid window. The typical value of tDQSQ is 0.85 ns (max) and 1 ns (max) for tQHS at 200 MB/s. GPMI will sample NAND_DATA[7:0] at both rising and falling edge of an delayed NAND_DQS signal, which can be provided by an internal DPLL. The delay value can be controlled by GPMI register GPMI_READ_DDR_DLL_CTRL.SLV_DLY_TARGET (see the GPMI chapter of the *i.MX 8M Plus Applications Processor Reference Manual* [IMX8MPRM]). Generally, the typical delay value of this register is equal to 0x7 which means 1/4 clock cycle delay expected. But if the board delay is big enough and cannot be ignored, the delay value should be made larger to compensate the board delay.

3.8.5.3 ONFI NV-DDR2 mode (ONFI 3.2 compatible)

3.8.5.3.1 Command and address timing

ONFI 3.2 mode command and address timing is the same as ONFI 1.0 compatible Async mode AC timing. See [Section 3.8.5.1, Asynchronous mode AC timing \(ONFI 1.0 compatible\)](#) for details.

3.8.5.3.2 Read and write timing

ONFI 3.2 mode read and write timing is the same as Toggle mode AC timing. See [Section 3.8.5.4, Toggle mode AC Timing](#) for details.

3.8.5.4 Toggle mode AC Timing

3.8.5.4.1 Command and address timing

NOTE

Toggle mode command and address timing is the same as ONFI 1.0 compatible Asynchronous mode AC timing. See [Section 3.8.5.1, Asynchronous mode AC timing \(ONFI 1.0 compatible\)](#) for details.

⁴ PRE_DELAY + 1 ≥ (AS + DS)

⁵ Shown in Figure 36.

⁶ Shown in Figure 37.

For DDR Toggle mode, Figure 35 shows the timing diagram of NAND_DQS/NAND_DATA_{xx} read valid window. The typical value of tDQSQ is 1.4 ns (max) and 1.4 ns (max) for tQHS at 133 MB/s. GPMI samples NAND_DATA[7:0] at both the rising and falling edges of a delayed NAND_DQS signal, which is provided by an internal DPLL. The delay value of this register can be controlled by the GPMI register GPMI_READ_DDR_DLL_CTRL.SLV_DLY_TARGET (see the GPMI chapter of the *i.MX 8M Plus Applications Processor Reference Manual* [IMX8MPRM]). Generally, the typical delay value is equal to 0x7, which means a 1/4 clock cycle delay is expected. But if the board delay is big enough and cannot be ignored, the delay value should be made larger to compensate the board delay.

3.8.6 I²C bus characteristics

The Inter-Integrated Circuit (I2C) provides functionality of a standard I2C master and slave. The I2C is designed to be compatible with the I2C Bus Specification, version 2.1, by Philips Semiconductor (now NXP Semiconductors).

3.8.7 CAN network AC electrical specifications

The Controller Area Network (CAN) module is a communication controller implementing the CAN protocol according to the CAN 2.0B protocol specification. The processor has two CAN modules available. Tx and Rx ports for both modules are multiplexed with other I/O pins. See the IOMUXC chapter of the device reference manual to see which pins expose Tx and Rx pins; these ports are named CAN_TX and CAN_RX, respectively.

3.8.8 HDMI Tx module parameters

The HDMI 2.0a Tx interface (controller and PHY) is compliant with following specifications:

- *HDMI 2.0a Specification*
- *HDMI 1.4b Specification*

Level shifters are required on HDMI_DDC_SCL, HDMI_DDC_SDA, HDMI_HPD, HDMI_CEC signals to shift the original 3.3 V or 1.8 V level to 5 V required by HDMI interface.

3.8.9 MIPI D-PHY parameters

MIPI D-PHY electrical specifications are compliance.

Typical values measured at AVDD = 1.8 V, AVSS = 0 V, T_J = 25°C; unless otherwise specified.

3.8.10 PCIe 3.0 PHY parameters

The PCIe interface is designed to be compatible with PCIe specification Gen3 x1 lane and supports the PCI Express 1.1/2.0/3.0 standards.

3.8.10.1 PCIe DC parameters

The DC parameters of PCIe are compliant with *PCI Express Base Specification, rev3.0*.

3.8.10.2 PCIE_RESREF reference resistor connection

The external resistor-referred current is generated by using 8.2 kΩ, 1% precision resistor, which is connected between the PCIE_RESREF pad and ground outside the chip.

3.8.11 Pulse width modulator (PWM) timing parameters

This section describes the electrical information of the PWM. The PWM can be programmed to select one of three clock signals as its source frequency. The selected clock signal is passed through a prescaler before being input to the counter. The output is available at the pulse-width modulator output (PWMO) external pin.

Figure 38 depicts the timing of the PWM, and Table 55 lists the PWM timing parameters.

3.8.12 FlexSPI timing parameters

Measurement is with a load of 35 pF on SCK and SIO pins and an input slew rate of 1 V/ns.

3.8.12.1 FlexSPI input/read timing

There are three sources for the internal sample clock for FlexSPI read data:

- Dummy read strobe generated by FlexSPI controller and looped back internally (FlexSPI_n_MCR0[RXCLKSRC] = 0x0)
- Dummy read strobe generated by FlexSPI controller and looped back through the DQS pad (FlexSPI_n_MCR0[RXCLKSRC] = 0x1)
- Read strobe provided by memory device and input from DQS pad (FlexSPI_n_MCR0[RXCLKSRC] = 0x3)

The following sections describe input signal timing for each of these four internal sample clock sources.

3.8.13 SAI/I2S switching specifications

This section provides the AC timings for the SAI in Master (clocks driven) and Slave (clocks input) modes. All timings are given for non inverted serial clock polarity (SAI_TCR[TSCKP] = 0, SAI_RCR[RSCKP] = 0) and non inverted frame sync (SAI_TCR[TFSI] = 0, SAI_RCR[RFSI] = 0). If the polarity of the clock and/or the frame sync have been inverted, all the timings remain valid by inverting the clock signal (SAI_BCLK) and/or the frame sync (SAI_FS) shown in the figures below.

Table 65. Master mode SAI timing (50 MHz)¹

Num	Characteristic	Min	Max	Unit
S1	SAI_MCLK cycle time	20	—	ns
S2	SAI_MCLK pulse width high/low	40%	60%	MCLK period
S3	SAI_BCLK cycle time	20	—	ns
S4	SAI_BCLK pulse width high/low	40%	60%	BCLK period
S5	SAI_BCLK to SAI_FS output valid	—	2	ns
S6	SAI_BCLK to SAI_FS output invalid	0	—	ns
S7	SAI_BCLK to SAI_TXD valid	—	2	ns
S8	SAI_BCLK to SAI_TXD invalid	0	—	ns
S9	SAI_RXD/SAI_FS input setup before SAI_BCLK	2	—	ns
S10	SAI_RXD/SAI_FS input hold after SAI_BCLK	0	—	ns

¹ To achieve 50 MHz for BCLK operation, the following configuration must be used. In TX, configure BCI=0 in SAI TCR2 register and FSD=1 in SAI TCR4 register and in RX, configure BCI=1 in SAI TCR2 register and FSD=0 in SAI TCR4 register.

Table 66. Master mode SAI timing (25 MHz)

Num	Characteristic	Min	Max	Unit
S1	SAI_MCLK cycle time	40	—	ns
S2	SAI_MCLK pulse width high/low	40%	60%	MCLK period
S3	SAI_BCLK cycle time	40	—	ns
S4	SAI_BCLK pulse width high/low	40%	60%	BCLK period

Table 66. Master mode SAI timing (25 MHz) (continued)

Num	Characteristic	Min	Max	Unit
S5	SAI_BCLK to SAI_FS output valid	—	2	ns
S6	SAI_BCLK to SAI_FS output invalid	0	—	ns
S7	SAI_BCLK to SAI_TXD valid	—	2	ns
S8	SAI_BCLK to SAI_TXD invalid	0	—	ns
S9	SAI_RXD/SAI_FS input setup before SAI_BCLK	12	—	ns
S10	SAI_RXD/SAI_FS input hold after SAI_BCLK	0	—	ns

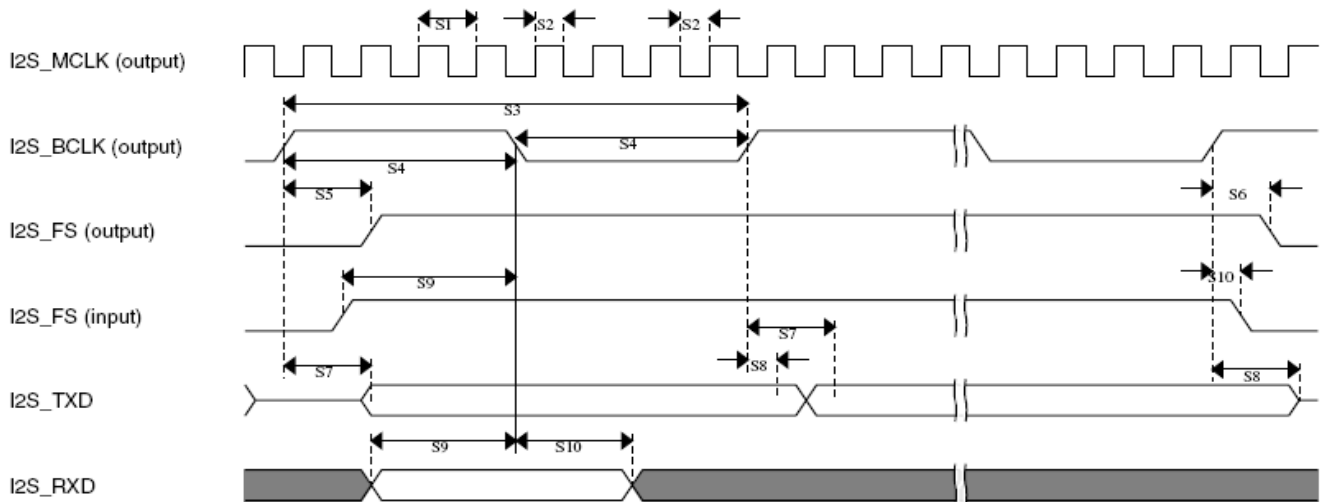

Figure 46. SAI timing—Master modes

Table 67. Slave mode SAI timing (50 MHz)¹

Num	Characteristic	Min	Max	Unit
S11	SAI_BCLK cycle time (input)	20	—	ns
S12	SAI_BCLK pulse width high/low (input)	40%	60%	BCLK period
S13	SAI_FS input setup before SAI_BCLK	2	—	ns
S14	SAI_FA input hold after SAI_BCLK	2	—	ns
S17	SAI_RXD setup before SAI_BCLK	2	—	ns
S18	SAI_RXD hold after SAI_BCLK	2	—	ns

¹ TX does not support 50 MHz operation in Slave mode. To achieve 50 MHz BCLK in RX, configure BCI=1 in SAI TCR2 register and FSD=0 in SAI TCR4 register.

Table 68. Slave mode SAI timing (25 MHz)

Num	Characteristic	Min	Max	Unit
S11	SAI_BCLK cycle time (input)	40	—	ns
S12	SAI_BCLK pulse width high/low (input)	40%	60%	BCLK period
S13	SAI_FS input setup before SAI_BCLK	12	—	ns
S14	SAI_FA input hold after SAI_BCLK	2	—	ns
S15	SAI_BCLK to SAI_TXD/SAI_FS output valid	—	7	ns
S16	SAI_BCLK to SAI_TXD/SAI_FS output invalid	0	—	ns

3.8.14 SPDIF timing parameters

The Sony/Philips Digital Interconnect Format (SPDIF) data is sent using the bi-phase marking code. When encoding, the SPDIF data signal is modulated by a clock that is twice the bit rate of the data signal.

Table 69, Figure 48, and Figure 49 show SPDIF timing parameters for the Sony/Philips Digital Interconnect Format (SPDIF), including the timing of the modulating Rx clock (SPDIF_SR_CLK) for SPDIF in Rx mode and the timing of the modulating Tx clock (SPDIF_ST_CLK) for SPDIF in Tx mode.

Table 69. SPDIF timing parameters

Parameter	Symbol	Timing Parameter Range		Unit
		Min	Max	
SPDIF_IN Skew: asynchronous inputs, no specs apply	—	—	0.7	ns
SPDIF_OUT output (Load = 50 pf)				
• Skew	—	—	1.5	ns
• Transition rising	—	—	24.2	
• Transition falling	—	—	31.3	
SPDIF_OUT output (Load = 30 pf)				
• Skew	—	—	1.5	ns
• Transition rising	—	—	13.6	
• Transition falling	—	—	18.0	
Modulating Rx clock (SPDIF_SR_CLK) period	srckp	40.0	—	ns
SPDIF_SR_CLK high period	srckph	16.0	—	ns
SPDIF_SR_CLK low period	srckpl	16.0	—	ns
Modulating Tx clock (SPDIF_ST_CLK) period	stckp	40.0	—	ns
SPDIF_ST_CLK high period	stckph	16.0	—	ns
SPDIF_ST_CLK low period	stckpl	16.0	—	ns

3.8.15 UART I/O configuration and timing parameters

3.8.15.1 UART RS-232 I/O configuration in different modes

The i.MX 8M Plus UART interfaces can serve both as DTE or DCE device. This can be configured by the DCEDTE control bit (default 0—DCE mode). Table 70 shows the UART I/O configuration based on the enabled mode.

Table 70. UART I/O configuration vs. mode

Port	DTE Mode		DCE Mode	
	Direction	Description	Direction	Description
UARTx_RTS_B	Output	UARTx_RTS_B from DTE to DCE	Input	UARTx_RTS_B from DTE to DCE
UARTx_CTS_B	Input	UARTx_CTS_B from DCE to DTE	Output	UARTx_CTS_B from DCE to DTE
UARTx_TX_DATA	Input	Serial data from DCE to DTE	Output	Serial data from DCE to DTE

3.8.15.2 UART RS-232 Serial mode timing

This section describes the electrical information of the UART module in the RS-232 mode.

3.8.15.2.1 UART transmitter

Figure 50 depicts the transmit timing of UART in the RS-232 Serial mode, with 8 data bit/1 stop bit format. Table 71 lists the UART RS-232 Serial mode transmit timing characteristics.

Figure 50. UART RS-232 Serial mode transmit timing diagram

Table 71. RS-232 Serial mode transmit timing parameters

ID	Parameter	Symbol	Min	Max	Unit
UA1	Transmit Bit Time	t_{Tbit}	$1/F_{baud_rate}^1 - T_{ref_clk}^2$	$1/F_{baud_rate} + T_{ref_clk}$	—

¹ F_{baud_rate} : Baud rate frequency. The maximum baud rate the UART can support is $(ipg_perclk \text{ frequency})/16$.

² T_{ref_clk} : The period of UART reference clock ref_clk (ipg_perclk after RFDIV divider).

3.8.15.2.2 UART receiver

Figure 51 depicts the RS-232 Serial mode receive timing with 8 data bit/1 stop bit format. Table 72 lists Serial mode receive timing characteristics.

Figure 51. UART RS-232 Serial mode receive timing diagram

Table 72. RS-232 Serial mode receive timing parameters

ID	Parameter	Symbol	Min	Max	Unit
UA2	Receive Bit Time ¹	t_{Rbit}	$1/F_{baud_rate}^2 - 1/(16 \times F_{baud_rate})$	$1/F_{baud_rate} + 1/(16 \times F_{baud_rate})$	—

¹ The UART receiver can tolerate $1/(16 \times F_{baud_rate})$ tolerance in each bit. But accumulation tolerance in one frame must not exceed $3/(16 \times F_{baud_rate})$.

² F_{baud_rate} : Baud rate frequency. The maximum baud rate the UART can support is $(ipg_perclk \text{ frequency})/16$.

3.8.16 USB PHY parameters

The USB PHY parameters meet the electrical compliance requirements listed as following:

- *Universal Serial Bus Revision 3.0 Specification* (including ECNs and errata), *On-The-Go and Embedded Host Supplement to the USB 3.0 Specification* (including ECNS and Errata)
- *Universal Serial Bus Revision 2.0 Specification* (including ECNs and errata), *On-The-Go and Embedded Host Supplement to the Universal Serial Bus Revision 2.0 Specification* (including ECNs and errata)

3.8.16.1 Pad/Package/Board connections

The USBx_VBUS pin cannot directly connect to 5 V VBUS voltage on the USB2.0 link, each USBx_VBUS pin must be isolated by an external 30 K Ω 1% precision resistor if connects to 5 V VBUS.

The USB 2.0 PHY uses USBx_TXRTUNE and an external resistor to calibrate the USBx_DP/DN 45 Ω source impedance. The external resistor value is 200 Ω 1% precision on each of USBx_TXRTUNE pad to ground.

3.8.16.2 USB PHY worst power consumption

Table 73 shows the USB 2.0 PHY worst power dissipation.

Table 73. USB 2.0 PHY worst power dissipation

Mode	VDD_USB_0P8		VDD_USB_3P3		VDD_USB_1P8		Total Power

4 Boot mode configuration

This section provides information on Boot mode configuration pins allocation and boot devices interfaces allocation.

4.1 Boot mode configuration pins

Table 74 provides boot options, functionality, fuse values, and associated pins. Several input pins are also sampled at reset and can be used to override fuse values, depending on the value of BT_FUSE_SEL fuse. The boot option pins are in effect when BT_FUSE_SEL fuse is '0' (cleared, which is the case for an unblown fuse). For detailed Boot mode options configured by the Boot mode pins, see the “System Boot, Fusemap, and eFuse” chapter in the *i.MX 8M Plus Applications Processor Reference Manual* (IMX8MPRM).

Table 74. Fuses and associated pins used for boot

Interface	IP instance	Allocated pads during boot	Comment
BOOT_MODE0	Input	ccmsrcgpcmix.BOOT_MODE[0]	Boot mode selection
BOOT_MODE1	Input	ccmsrcgpcmix.BOOT_MODE[1]	
BOOT_MODE2	Input	ccmsrcgpcmix.BOOT_MODE[2]	
BOOT_MODE3	Input	ccmsrcgpcmix.BOOT_MODE[3]	

4.2 Boot device interface allocation

Table 75 lists the interfaces that can be used by the boot process in accordance with the specific Boot mode configuration. The table also describes the interface's specific modes and IOMUXC allocation, which are configured during boot when appropriate.

Table 75. Interface allocation during boot

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Suitability for use in non-automotive qualified products — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

Translations — A non-English (translated) version of a document, including the legal information in that document, is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

Security — Customer understands that all NXP products may be subject to unidentified vulnerabilities or may support established security standards or specifications with known limitations. Customer is responsible for the design and operation of its applications and products throughout their lifecycles to reduce the effect of these vulnerabilities on customer's applications and products. Customer's responsibility also extends to other open and/or proprietary technologies supported by NXP products for use in customer's applications. NXP accepts no liability for any vulnerability. Customer should regularly check security updates from NXP and follow up appropriately.

Customer shall select products with security features that best meet rules, regulations, and standards of the intended application and make the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP.

NXP has a Product Security Incident Response Team (PSIRT) (reachable at PSIRT@nxp.com) that manages the investigation, reporting, and solution release to security vulnerabilities of NXP products.
