

0.38 GHz to 15 GHz RxVGA

FEATURES

- Broadband RxVGA interfacing LNA and beamformer to RF ADC
- ▶ Operating frequency range: 0.38 GHz to 15 GHz, two product variants
 - ADL6332-A: 0.38 GHz to 8.0 GHz
 - ▶ ADL6332-B: 1.0 GHz to 15.0 GHz
- ▶ Differential signal chain optimizes common-mode rejection of RF ADC, even order harmonics, and intermodulation
- \triangleright 50 Ω single-ended input and 50 Ω differential outputs
- ▶ Integrated broadband RF input balun
- ▶ 70 dB of gain control range in 1 dB step
- ▶ RF DSA range: 24.0 dB with 1.0 dB step
- Amplifier bypass loss of 12 dB each
- ► Asynchronous toggle between multiple predefined attenuation values and bypass amplifier stages
- Power gain at 4 GHz: 15.0 dB (ADL6332-A), 15.7 dB (ADL6332-B)
- ▶ Noise figure at 4 GHz: 8.5 dB (ADL6332-A), 8.5 dB (ADL6332-B)
- ▶ OIP3 at 4 GHz: 32.8 dBm (ADL6332-A), 30.9 dBm (ADL6332-B)
- ▶ OIP2 at 4 GHz: 59.6 dBm (ADL6332-A), 55.5 dBm (ADL6332-B)
- OP1dB at 4 GHz: 11.8 dBm (ADL6332-A), 12.6 dBm (ADL6332-B)
- ▶ Fully programmable through a 3-wire/4-wire SPI
- ▶ Single 3.3 V supply
- ▶ 24-terminal, 4.0 mm x 4.0 mm LGA

APPLICATIONS

- Aerospace and defense
- Instrumentation and test equipment
- Communication systems

GENERAL DESCRIPTION

The ADL6332 RxVGA provides an interface from LNA/beam former/Rx front end to RF analog-to-digital converters (RF-ADC). Each ADL6332 IC is composed of a balun, two differential RF amplifiers with bypass attenuators, and a digital step attenuator (DSA) to provide suitable receiver performance in a 24-terminal, 4.0 mm x 4.0 mm LGA package.

Serial-port interface (SPI) control is available to configure RF signal path or to optimize supply current vs. performance.

An integrated RF balun is used to provide a single-ended input over 0.38 GHz to 8.0 GHz (ADL6332-A) or 1.0 GHz to 15.0 GHz (ADL6332-B) with good impedance match.

Table 1. ADL6332 Frequency Ranges

| ADL6332 Variant | Frequency Range (GHz) |
|-----------------|-----------------------|
| A | 0.38 to 8.0 |
| В | 1.0 to 15.0 |

¹ The full fixed gain mode is configured with the fixed gain configurations in AMP1 and AMP2, and DSA = 0 dB with the factory optimized parameters.

DIGITAL LOGIC TIMING

 $C_{LOAD} = 25 pF$

Table 3. SPI Timing Specifications

| Parameter | r Description | | | Max | Unit |
|-------------------|---|----|--|-----|------|
| f _{SCLK} | Maximum serial-clock rate | | | 25 | MHz |
| t _{PWH} | Minimum period that SCLK is in logic-high state | 10 | | | ns |
| t_{PWL} | Minimum period that SCLK is in logic-low state | 10 | | | ns |

analog.com Rev. A | 7 of 55

² The bypass attenuation mode is configured with the bypass settings in AMP1 or AMP2, and DSA = 0 dB with the factory optimized parameters. Bypassing an amplifier with the attenuation mode reduces the total current typically by 230 mA per amplifier.

OIP2L refers to the two tone difference frequency, OIP2H refers to the two tone summation frequency.

⁴ IIP2L refers to the two tone difference frequency, IIP2H refers to the two tone summation frequency.

⁵ Exceeds the absolute maximum rating.

⁶ Not applicable. For ADL6332-A, an input signal frequency ≥ 4 GHz makes OIP2H/IIP2H beyond the operating frequency range.

Not applicable. For ADL6332-B, an input signal frequency ≥ 7.5 GHz makes OIP2H/IIP2H beyond the operating frequency range.

ABSOLUTE MAXIMUM RATINGS

Table 4. Absolute Maximum Ratings

| Parameter | Rating |
|--|------------------|
| V33AMP1, V33AMP1A, V33AMP2, V33AMP2A, V33FUSE | -0.3 V to +3.6 V |
| RFIN | 10 dBm |
| SCLK, SDO, SDIO, CSB, CA0, CA1, CA2, ENP, ATTSEL0, ATTSEL1 | -0.3 V to +3.6 V |
| Maximum Junction Temperature | 125°C |
| Operating Temperature Range (Measured at the Exposed Pad) | -40°C to +105°C |
| Storage Temperature Range | -65°C to +150°C |

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

Thermal performance is directly linked to printed circuit board (PCB) design and operating environment. Careful attention to PCB thermal design is required.

 θ_{JC} is the conduction thermal resistance from junction to case, where the case temperature is measured at the bottom of the package.

The thermal resistance value specified in Table 5 is simulated based on JEDEC specifications (unless specified otherwise) and must be used in compliance with JESD51-12.

Table 5. Thermal Resistance

| Package Type | θ_{JC} | Unit |
|--------------|---------------|------|
| CC-24-17 | 9.6 | °C/W |

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

THEORY OF OPERATION

The ADL6332 integrates two amplifiers with fixed gain (AMP1 \approx 12 dB and AMP2 \approx 10 dB) and a DSA, which is adjustable from 0 dB to 24 dB in 1 dB step. The AMP1 and AMP2 have a bypass attenuation mode, which allows to disable these amplifiers individually and route the RF signals through the fixed 12 dB attenuators. When an amplifier is configured in the bypass attenuation mode, the gain drops by approximately 24 dB for AMP1 and 22 dB for AMP2 (delta gain from AMP enabled to bypass attenuation mode); therefore, enabling an overall gain control range of 70 dB in 1 dB step when used with the 24 dB DSA.

Additionally, in the bypass attenuation mode, the amplifiers' current drops to almost zero.

All circuit blocks of the ADL6332, as shown in Figure 93, are programmable through the SPI.

RF INPUT AND OUTPUT

The ADL6332 input impedance is 50 Ω single-ended, and the output impedance is 50 Ω differential, which provides an interface from a 50 Ω single-ended LNA to RF-ADCs with 50 Ω differential input impedance in a signal chain without any matching networks.

analog.com Rev. A | 26 of 55

PROGRAMMABILITY GUIDE

The register map can be subdivided into seven functional groups, as shown in Table 7. See the Register Summary section for a complete list of all the registers on the ADL6332.

Table 7. Memory Map Functional Groups

| Register Address | Functional Blocks |
|------------------|--|
| 0x000 to 0x011 | SPI configuration |
| 0x100 to 0x101 | Function enable |
| 0x104 to 0x109 | AMP1 performance trimming and tuning |
| 0x10A to 0x10D | RF path four preconfigurations: AMP1, AMP2, fixed gain/bypass, DSA attenuation |
| 0x10F to 0x115 | AMP2 performance trimming and tuning |
| 0x120 to 0x121 | Auxiliary mux selection (debug only), SPI supply control |

Table 7. Memory Map Functional Groups (Continued)

| Register Address | Functional Blocks |
|------------------|---|
| 0x140 to 0x145 | FUSE space. Read only. Trimmed parameters for AMP1 and AMP2 are stored. |

FUNCTION AND SIGNAL PATH ENABLE

The enable bits for each circuit block are in registers 0x100 and 0x101 (Table 8 and Table 9). Figure 93 shows a breakdown of the individual blocks highlighted in red that have corresponding enable controls in registers 0x100 and 0x101. ENP pin 12 is a primary enable pin for the ADL6332 and is active high. The bits in the enable registers can be configured independent of the state of ENP.

PROGRAMMABILITY GUIDE

AMP1 AND AMP2 TRIMMING AND TUNING

Initial optimization of the amplifiers is performed at the factory and the optimized/trimmed parameters are stored in the non-volatile memory (NVM) referred to as the FUSE block. When the MSB in registers 0x104, 0x105, 0x106 for AMP1 and in registers 0x110, 0x111, 0x112 for AMP2 is 1 (default), the factory trimmed parameters are automatically used in the operation (normal operation mode). These values are readable in registers 0x140, 0x141, 0x142, 0x143, 0x144, 0x145 (Table 16). When the MSB in registers 0x104, 0x105, 0x106 for AMP1 and 0x110, 0x111, 0x112 for AMP2 is set to 0, the following registers are tunable by the user:

► AMP1_IGREF in register 0x104

▶ AMP1 IDREF Z in register 0x105

- ▶ AMP1 IDREF P in register 0x106
- ▶ AMP2 IGREF in register 0x110
- ► AMP2 IDREF Z in register 0x111
- ▶ AMP2 IDREF P in register 0x112

Bit 2

Use the default (reset) values in Register 0x103 to Register 0x115 in Table 10 for the ADL6332-A only. For the ADL6332-B, to achieve the optimal performance of OIP3 over its wide frequency range, both AMP1_CROSS_Z in Register 0x107 and AMP2_CROSS_Z in Register 0x113 need to be set to 0. If the lower current consumption is required, see the Applications Information section.

PROGRAMMABILITY GUIDE

RF PATH PRECONFIGURATION

ADL6332 has four preconfigurable RF gain settings, which are selected with the ATTSEL0 and ATTSEL1 pins. The configurable parameters (fixed gain or bypass attenuation mode in AMP1 and AMP2, and DSA attenuation level) are stored in four register spaces (Table 11, Table 12, Table 13, Table 14, Table 15), which are called RF State A, B, C, and D.

- State A: SIG_PATH0_2 in Register 0x10A
- State B: SIG PATH1 2 in Register 0x10B
- Table 11. Four Preconfiguration Registers with Default/Reset RF Parameters

- State C: SIG PATH2 2 in Register 0x10C
- State D: SIG_PATH3_2 in Register 0x10D

Each mode can configure the full RF chain after reset is asserted. Table 11 shows the default settings for each mode. Overwrite the parameters before or during operation.

This feature allows to switch the RF performance rapidly using asynchronous external control.

PROGRAMMABILITY GUIDE

AUXILIARY MUX OUT/TEMPERATURE SENSOR

The ADL6332 has multiple auxiliary mux control blocks that allow various modes of operation and monitoring point. All are available, but many parameters are used for monitoring during the manufacturing process by ADI. The default (reset) register configuration allows to monitor an internal voltage that is proportional to temperature, which can be used to track temperature changes from MUXOUT pin 7. If there is no need to use the temperature sensor

feature, it may be disabled by setting zeros in AMUX_BG_EN[4] and LDO18 EN[0] at 0x100 register.

NVM (FUSE) SPACE (REFERENCE ONLY)

Non-volatile memory (NVM) space is invisible but values from NVM are loaded to registers 0x140, 0x141, 0x142, 0x143, 0x144, 0x145 (Table 16), and these values are used when the MSB in registers 0x104, 0x105, 0x106 for AMP1 and 0x110, 0x111, 0x112 for AMP2 is 1 (default/reset).

SERIAL PORT INTERFACE (SPI)

The SPI of the ADL6332 allows to configure the device for specific functions or operations through 3-wire or 4-wire SPI mode. This serial port interface consists of four control lines: SCLK, SDIO, SDO, and CSB for 4-wire SPI mode. SCLK, SDIO, and CSB are used for 3-wire SPI mode, which is the default state for the SPI mode. To enable 4-wire SPI mode, set SDOACTIVE[3] and SDOACTIVE_[4] in register 0x000 to 1. Table 3 shows the timing requirements for the SPI port.

The ADL6332 protocol consists of a read/write bit, four chip address bits (MSB is always 0), nine register address bits, followed by eight data bits. Both the address and data fields are organized with the MSB first and end with the LSB by default. To address the device correctly, the chip address prefix bits must match the externally configured chip address pins CA2, CA1, and CA0.

The ADL6332 input logic levels to write to the SPI are 1.8 V or 3.3 V.

On a readback cycle, the SDO is configurable for either 1.8 V (default) or 3.3 V readback output levels by setting SPI_1P8_3P3_CTRL bit (register 0x121, bit 4).

CONFIGURING MULTIPLE CHIPS TO SHARE THE SPI BUS

Up to eight ADL6332 devices can be addressed using the same 3-wire or 4-wire SPI, using a single CSB line for all devices. For this capability, the chip address pins (CA2, CA1, CA0) of the ADL6332 are used to identify the chip with the SPI write chip address prefix (see the SPI port as shown in Figure 2).

The ADL6332 ignores any writes to addresses where the four MSBs are not equal to the chip address as set by the chip address pins and only accepts access for addresses where the four MSB chip address prefix bits are equal to the chip address pins. The only exception is the software reset in the address 0x000. All ADL6332 chips on the shared bus accept 0x81 software reset in 0x000 register from the SPI host controller.

Figure 94 shows how to configure the chip address pins CA2, CA1, and CA0 with the associated chip address prefix bits.

Figure 94. Multiple Chip Configuration to Share SPI Bus

analog.com Rev. A | 33 of 55

SERIAL PORT INTERFACE (SPI)

INITIALIZATION SEQUENCE

ADL6332 has a built-in initialization sequence triggered by software reset to correctly load data from the NVM into memory for normal amplifier operation. The calibrated/trimmed settings for AMP1 and AMP2 are programmed in Analog Devices' factory and stored in NVM before shipping. After a software reset is performed, the data in the NVM must be loaded into the digital registers 0x140 to 0x145 for operation. This loading process takes four SPI cycles, write or read, after the software reset is asserted. The loading process is independent of the state of the ENP pin, high or low.

The full procedure for initializing the part is:

- 1. Supply 3.3 V.
- 2. Apply software reset.
- 3. Send four SPI commands to ADL6332, read or write.

The software reset, sending 0x81 in register 0x000, is always recommended right after 3.3 V is supplied.

Example 1 (Table 17):

After 3.3 V is supplied:

- 1. Write 0x81 in register 0x000 for the software reset.
- 2. Write 0x18 in register 0x000 for configuring 4-wire SPI mode.
- 3. Write 0x01 in register 0x00A: Scratch pad.
- **4.** Write 0x02 in register 0x00A: Scratch pad.
- **5.** Write 0x03 in register 0x00A: Scratch pad.
- **6.** Write 0x07 in register 0x101 for enabling AMP2, DSA, and AMP1 to start the normal amplifier operation.

Register 0x00A is called 'Scratch Pad', which is a read and write register for SPI communication testing. It does not affect any performance in the ADL6332.

After four write cycles are sent, the data in registers 0x140 to 0x145 are correctly loaded for use in operation.

Example 1 is the basic sequence to start ADL6332 in normal operation. After the sequence is complete, the registers are set to default configuration. It is recommended to enable AMP2, DSA, and AMP1 in register 0x101, in the last SPI cycle in step 6 to avoid any unexpected output signals from ADL6332 when ENP pin is set to high together with the 3.3 V supply.

Table 17. Example 1: SPI Command Writes

| Address | Write Data | Notes | |
|---------|------------|--|--|
| 0x000 | 0x81 | Software reset | |
| 0x000 | 0x18 | 1st Cycle: Configure 4-wire SPI mode. | |
| 0x00A | 0x01 | 2nd Cycle: Scratch pad writing. Any data is fine. | |
| 0x00A | 0x02 | 3rd Cycle: Scratch pad writing. Any data is fine. | |
| 0x00A | 0x03 | 4th Cycle: Scratch pad writing. Any data is fine. | |
| 0x101 | 0x07 | The data in registers 0x140 to 0x145 are correctly loaded to use for operation. Enable AMP2, DSA, AMP1 functions to start operations. Default register values are used for RF performance. | |

BASIC CONNECTIONS

Figure 95. Basic Connections

Table 18. Basic Connections

| Functional Blocks | Pin No. | Mnemonic | Description | Basic Connection |
|------------------------|-----------------|---|---|--|
| 3.3 V | 8, 9, 10, 11 | V33AMP1A, V33AMP1, V33AMP2A, V33AMP2 | Amplifier, analog supply voltage | Decouple this pin through 220 pF, 0.1 µF capacitors to ground. Ensure that the decoupling capacitors are located close to the pin. |
| 3.3 V | 22 | V33FUSE | Digital, DSA, other bias voltage | Decouple this pin through 220 pF, 0.1 µF capacitors to ground. Ensure that the decoupling capacitors are located close to the pin. |
| Preprogrammed Mode | 13, 6 | ATTSEL0, ATTSEL1 | Preprogrammed mode selection | |
| RF Input | 3 | RFIN | RF single-ended input | $50\ \Omega$ single-ended input. AC-coupled is always recommended. |
| RF Output | 15, 16 | RFOUTN, RFOUTP | RF differential output | $50\;\Omega$ differential outputs. AC-coupled is always recommended. |
| Serial Port | 21 | CSB | Active-low chip select | 1.8 V to 3.3 V tolerant logic levels. |
| | 20 | SCLK | SPI clock | 1.8 V to 3.3 V tolerant logic levels. |
| | 18 | SDO | SPI data input | 1.8 V to 3.3 V tolerant logic levels. |
| | 19 | SDIO | SPI date input/output | 1.8 V to 3.3 V tolerant logic levels. |
| Chip Address Selection | 23, 24, 1 | CA0, CA1, CA2 | SPI chip address selects | Chip address selection. |
| Device Enable | 12 | ENP | Active-high for normal operation | |
| Ground | 2, 4, 5, 14, 17 | GND | Ground | Connect these pins to the ground of the printed circuit board. |
| EPAD | Exposed pad | Exposed pad | Exposed pad | Exposed pad. The exposed pad must be connected to ground for electrical and thermal purposes. |
| MUXOUT | 7 | MUXOUT | Analog voltage output from the temperature sensor | Voltage measurement pin for reading chip temperature. Leave as no connect when not in use. |

APPLICATIONS INFORMATION

CURRENT CONSUMPTION OPTIMIZATION

When the MSB in 0x104, 0x105, and 0x106 registers for AMP1 and 0x110, 0x111, and 0x112 registers for AMP2 are set to 0, these six registers are tunable. If a lower current consumption is needed, the settings of both AMP1_IGREF in Register 0x104 and AMP2_IGREF in Register 0x110 can be reduced according to the readback value of factory trimmed IGREF in Register 0x140 and Register 0x143 for AMP1 and AMP2, respectively (see Figure 96 and Figure 97). As a result, the OIP3 performance is degraded, as shown in Figure 98 and Figure 99.

It is not recommended to increase the IGREF settings greater than the readback value for AMP1 and AMP2. Doing so could impact the long term reliability of the part.

Figure 96. Total Current vs. IGREF Settings for Various Frequencies (ADL6332-A)

APPLICATIONS INFORMATION

AC COUPLING

The ESD clamps are located right after input ports and before the output port (see Figure 100). When a DC voltage greater than or equal to 1.0 V is applied as common-mode, there is a risk of latching the silicon controlled rectifier (SCR) clamps in the ESD protection block with a single spike. Even with a DC voltage less than 1 V, intermodulation (IM) performance of the part may be degraded. An external DC block capacitor for AC-coupled is always recommended.
