

# CIPOS™ Mini IPM

## IM06B15AC1, 600 V 15 A

### Description

The CIPOS™ Mini IPM product family offers the chance for integrating various power and control components to increase reliability and optimize PCB size and system cost. It is designed to control 3-phase motors in variable speed drives. The package concept is specially adapted to power applications, which need good thermal conduction and electrical isolation, but also less EMI and overload protection. To deliver excellent electrical performance, Infineon's leading-edge TRENCHSTOP™ IGBTs and anti-parallel diodes are combined with an optimized SOI gate driver.

### Features

#### Package

- Fully isolated dual in-line molded module
- Lead-free terminal plating; RoHS compliant

#### Inverter

- 650 V TRENCHSTOP™ IGBT7 T7
- 600 V rugged SOI gate driver technology with stability against transient and negative voltage
- Allowable negative  $V_S$  potential up to -11 V for signal transmission at  $V_{BS} = 15$  V
- Integrated bootstrap functionality
- Overcurrent shutdown
- Built-in NTC thermistor for temperature monitor
- Undervoltage lockout at all channels
- Low-side emitter pins accessible for phase current monitoring (open emitter)
- Cross-conduction prevention
- All of 6 switches turn off during protection

### Potential applications

- Air-conditioners, home appliances, motor drives

**Product validation**

Qualified for industrial applications according to the relevant tests of JEDEC47/20/22.

## 2.2 Pin description

### H<sub>IN</sub> (U, V, W) and L<sub>IN</sub> (U, V, W) (Low-side and high-side control pins, Pin 7 - 12)

These pins are positive logic, and they are responsible for the control of the integrated IGBTs. The Schmitt-trigger input thresholds of them are such to guarantee LSTTL and CMOS compatibility down to 3.3 V controller outputs. A pull-down resistor of about 5 kΩ is internally provided to pre-bias inputs during supply start-up, and a zener clamp is provided to protect the pins. Negative pulses down to an absolute minimum of -5.5 V are allowed that offers an outstanding robustness. Input Schmitt-trigger and noise filter provide noise rejection to short input pulses.

The noise filter suppresses control pulses shorter than the filter time  $t_{FIL,IN}$ . The Figure 4 describes how the filter works. An input pulse-width shorter than 1 μs is not recommended.

Figure 3 Input pin structure

Figure 4 Input filter timing diagram

The integrated gate driver additionally provides a shoot-through prevention capability that avoids the simultaneous on-states of the same leg. When both

inputs of the same leg are activated, only formerly activated one is remained activated so that the leg is kept steadily in a safe state.

A minimum deadtime insertion of typically 360 ns is also provided by driver to reduce cross-conduction of the IGBTs.

### V<sub>FO</sub> (Fault-output and NTC, Pin 14)

The V<sub>FO</sub> pin indicates a module failure in case of undervoltage at pin V<sub>DD</sub> or in case of triggered overcurrent detection at ITRIP. An external pull-up resistor is required.

Figure 5 Internal circuit at pin V<sub>FO</sub>

The sleep function is activated after each trigger of ITRIP or undervoltage lockout. A new edge input signal is mandatory to activate gate drives after fault-clear time as shown in **Error! Reference source not found.**

### I<sub>TRIP</sub> (Overcurrent detection function, Pin 15)

This product family provides an overcurrent detection function by connecting the ITRIP input with the IGBT current feedback. The ITRIP comparator threshold (typ. 0.525 V) is referenced to V<sub>SS</sub>. An input noise filter ( $t_{ITRIP}$  = typ. 530 ns) prevents the driver to detect false overcurrent events.

Overcurrent detection generates a shutdown of outputs of the gate driver. Fast track shutdown function allows low-side outputs to be turned off faster than high side outputs about 200 ns.

## Pin description

The fault-clear time is set to minimum 100  $\mu$ s.

### **V<sub>DD</sub>, V<sub>SS</sub> (Low-side control supply and reference, Pin 13, 16)**

V<sub>DD</sub> is the control supply, and it provides power both to input logic and to output stage. Input logic is referenced to V<sub>SS</sub> ground.

The undervoltage circuit enables the device to operate at power on when a supply voltage of at least a typical voltage of V<sub>DDUV+</sub> = 12.4 V is present.

The gate driver shuts down all the outputs, when the V<sub>DD</sub> supply voltage is below V<sub>DDUV-</sub> = 11.5 V. This prevents the IGBTs from critically low gate voltage levels during on-state and therefore from excessive power dissipation.

### **V<sub>B</sub> (U, V, W) and V<sub>S</sub> (U, V, W) (High-side supplies, Pin 1 - 6)**

V<sub>B</sub> to V<sub>S</sub> is the high-side supply voltage. The high-side circuit can float with respect to V<sub>SS</sub> following the high-side IGBT emitter voltage.

Due to the low power consumption, the floating driver stage is supplied by integrated bootstrap circuit.

The undervoltage detection operates with a rising supply threshold of typical V<sub>BSUV+</sub> = 11.5 V and a falling threshold of V<sub>BSUV-</sub> = 10.7 V.

V<sub>S</sub> (U, V, W) provide a high robustness against negative voltage in respect of V<sub>SS</sub> of -50 V transiently. This ensures very stable designs even under harsh conditions.

### **NW, NV, NU (Low-side emitter, Pin 17 - 19)**

The low-side emitters are available for current measurement of each phase leg. It is recommended to keep the connection to pin V<sub>SS</sub> as short as possible to avoid unnecessary inductive voltage drops.

### **W, V, U (High-side emitter and low-side collector, Pin 20 - 22)**

These pins are connected to motor U, V, W input pins.

### **P (Positive bus input voltage, Pin 23)**

The high-side IGBTs are connected to the bus voltage. It is noted that the bus voltage does not exceed 450 V.

Absolute maximum ratings
