

Title	<i>Reference Design Report for a 7.5 W Continuous, 13 W Peak DVD / Set Top Box Using TNY376PN</i>
Specification	85–265 VAC Input, 3.3 V (500 mA), 5 V (500 mA), 12 V (250 mA) and –12 V (30 mA) Outputs
Application	DVD / Set Top Box
Author	Power Integrations Applications Department
Document Number	RDR-115
Date	May 22, 2007
Revision	1.0

Summary and Features

- Excellent cross regulation without need for post regulator
- *EcoSmart*[®] – Meets Energy Star / CEC requirements
 - No-load consumption <150 mW at 265 VAC (no bias winding required)
 - > 70% active-mode efficiency
 - > 0.5 W output power available for 1 W input simplifies DVD player design
- BP/M capacitor value selects MOSFET current limit for greater design flexibility
- Tightly toleranced I²f parameter (–10%, +12%) reduces system cost:
 - Increases MOSFET and magnetics power delivery
 - Reduces overload power, which lowers output diode and capacitor costs
- Integrated *TinySwitch-PK* Safety/Reliability features:
 - Accurate (± 5%), auto-recovering, hysteretic thermal shutdown function maintains safe PCB temperatures under all conditions
 - Auto-restart protects against output short circuit and open loop fault conditions
 - > 3.2 mm creepage on package enables reliable operation in high humidity and high pollution environments
- Meets EN550022 and CISPR-22 Class B conducted EMI with >20 dB μ V margin

The products and applications illustrated herein (including circuits external to the products and transformer construction) may be covered by one or more U.S. and foreign patents or potentially by pending U.S. and foreign patent applications assigned to Power Integrations. A complete list of Power Integrations' patents may be found at www.powerint.com.

Important Note:

Although this board is designed to satisfy safety isolation requirements, the engineering prototype has not been agency approved. Therefore, all testing should be performed using an isolation transformer to provide the AC input to the prototype board.

2 Power Supply Specification

Description	Symbol	Min	Typ	Max	Units	Comment
Input						
Voltage	V_{IN}	85		265	VAC	2 Wire – no P.E.
Frequency	f_{LINE}	47	50/60	64	Hz	
No-load Input Power (230 VAC)				0.3	W	
Output						
Output Voltage 1	V_{OUT1}	3.135	3.3	3.465	V	± 5%
Output Ripple Voltage 1	$V_{RIPPLE1}$			100	mV	20 MHz bandwidth
Output Current 1	I_{OUT1}	0.1	0.5	0.6	A	
Output Voltage 2	V_{OUT2}	4.75	5.0	5.35	V	+7%,-5%
Output Ripple Voltage 2	$V_{RIPPLE2}$			66	mV	20 MHz bandwidth
Output Current 2	I_{OUT2}	0.2	0.5	0.6	A

4 Circuit Description

4.1 Input EMI Filtering

One requirement of this design was to meet conducted EMI with the output return connected to safety earth ground. This simulates the condition where the DVD player or set-top box is earth grounded either by an antenna or cable TV input cable.

The EMI filtering consists of a π filter formed by C1, L1 and C4 together with capacitor C8. A common mode choke was selected over discrete inductors for L1 to meet the earth grounded requirement. Such a simple arrangement was possible due to the switching frequency jitter feature of U4 and the E-Shield™ techniques used in the transformer. Provision for an additional X class capacitor (C3) is made on the board but is not required.

4.2 TinySwitch-PK Primary

The TNY376 (U4) has the following functions integrated onto a monolithic IC: a 700 V power MOSFET, a low-voltage CMOS controller, a high-voltage current source (provides startup and steady-state operational current to the IC), hysteretic thermal shutdown, and auto-restart. The excellent switching characteristics of the integrated power MOSFET allow efficient operation up to 132 kHz (264 kHz in Peak Power Mode).

Under normal operation, the rectified and filtered input voltage is applied to one side of the primary winding of T1. The other side of the T1 primary winding is connected to the DRAIN pin of U4. As soon as the voltage is applied across the DRAIN and SOURCE pins of U4, the internal high voltage current source (connected to the DRAIN pin of the IC) begins charging the capacitor (C19) connected to the BYPASS/MULTIFUNCTION (BP/M) pin. Once the voltage across C19 reaches 5.8 V, the controller enables MOSFET switching. MOSFET current is sensed (internally) by the voltage developed across the Drain to Source resistance ($R_{DS(ON)}$) while it is turned on. When the current reaches the preset (internal) current-limit trip point (I_{LIMIT}), the controller turns the MOSFET off.

The controller regulates the output voltage by skipping switching cycles (ON/OFF control) whenever the output voltage is above the reference level. During normal operation, MOSFET switching is disabled whenever the current flowing out of the EN/UV pin is greater than 90 μ A. If less than 90 μ A is flowing out of the EN/UV pin when the oscillator's (internal) clock signal occurs, MOSFET switching is enabled for that switching cycle, and the MOSFET turns on. That switching cycle terminates when the current through the MOSFET reaches I_{LIMIT} , or the DC_{MAX} signal is encountered. At full load, few switching cycles will be skipped (disabled) resulting in a high effective switching frequency. As the load reduces, more switching cycles are skipped, which reduces the effective switching frequency. At no-load, most switching cycles are skipped, which is what makes the no-load power consumption of supplies designed around the *TinySwitch-PK* family so low, since switching losses are the dominant loss mechanism at light loading. Additionally, since the amount of energy per switching cycle is fixed by

I_{LIMIT} , the skipping of switching cycles gives the supply a fairly consistent efficiency over the load range.

The *TinySwitch-PK* can supply additional output power to the load for short periods of time. If the MOSFET switching occurs for 14 consecutive clock cycles (132 kHz), the I_{LIMIT} increases, and the MOSFET is enabled to switch at 264 kHz. While in the Peak Power Mode of operation, if the MOSFET is disabled (via the feedback loop) for 12 consecutive clock cycles (264 kHz), then the *TinySwitch-PK* reverts back to its normal mode of operation at 132 kHz.

To limit the peak drain voltage spike caused by leakage inductance D5, R5, VR1, R7 and C2 form a clamp network. This arrangement offers the low EMI performance of an RCD clamp with the energy efficiency of a Zener clamp. By limiting the voltage across R7 and C2 using a Zener, the clamp voltage does not collapse as the output load, and therefore effective switching frequency, reduces. This prevents the clamp becoming a significant load at light load and therefore maintains high efficiency and low no-load input power.

4.3 Output Feedback

The output voltages of the +3.3 V and +5 V outputs are regulated by the sum of the currents through R15 and R16. The combined currents passing through R13 are regulated at 2.5 Volts by U3. If the voltage changes across R13, U3 changes the current through U2A (opto's LED), which proportionately changes the current through U2B (opto's transistor). If the collector current of U2B is greater than 90 μ A, U4 will skip the next switching cycle. If not, the switching cycle will occur. Sensing the outputs voltages via R15 and R16 helps improve the cross regulation between these outputs. The \pm 12 V outputs are cross regulated via the transformer's turns ratios. Optional capacitor C7 provides soft-finish, reducing the output voltage slew rate at start-up.

4.4 Bypass/Multifunction Pin

The *TinySwitch-PK*'s BP/M pin can be used to set the peak current limit of the primary switching cycle. This allows the designer more flexibility to optimize the power supply for the specific power range. Setting the current limit is done by selecting a capacitor value that is connected to the BP/M pin. The selection sizes are: 1.0 μ F, 0.1 μ F and 10 μ F. This sets the peak current threshold to the minimum, typical, and maximum level. Refer to the data sheet for the specific current limit for each *TinySwitch-PK* device.

*A TNY375P can be used for U4, with a reduced power output. See Appendix A in this report.

Note: Parts listed above are RoHS compliant.

7 Transformer Specification

7.1 Electrical Diagram

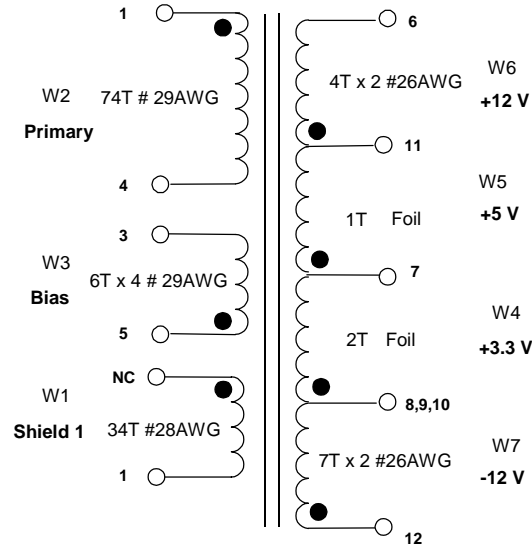

Figure 4 – Transformer Electrical Diagram.

7.2 Electrical Specifications

Electrical Strength	60Hz 1 second, from Pins 1-5 to Pins 6-12	3000 V ac
Primary Inductance	Pin 1 to Pin 4, all other windings open Measured at 132 kHz.	0.813 mH +/- 12%
Resonant Frequency	Pin 1 to Pin 4, all other windings open	300 kHz (Min.)
Primary Leakage Inductance	Pin 1 to Pin 4, Pins 6-12 shorted	30 μH Max.

7.3 Materials

Item	Description
[1]	Core: EEL19, Nicera NC-2H or equiv. gapped for AL of 150 nH/T ²
[2]	Bobbin: EEL19 Horizontal 12 pins
[3]	Magnet Wire: # 28 AWG
[4]	Magnet Wire: # 29 AWG
[5]	Magnet Wire: # 26 AWG
[6]	Teflon Tubing # 22
[7]	Margin Tape: 3M # 44 Polyester web. 3.0 mm wide
[8]	Copper Foil 0.52 mm thick, 12 mm wide.
[9]	Tape for Copper 2.0 mils thick, 16 mm wide.
[10]	Tape: 3M 1298 Polyester Film, 12.8 mm wide
[11]	Tape: 3M 1298 Polyester Film, 18.2 mm wide
[12]	Varnish

7.4 Transformer Build Diagram

Pin Side

NC = No Connection to a pin

Figure 5 – Transformer Build Diagram.

7.5 Copper Foil Preparation

The following figure shows the copper foils to be used for +3.3 V and +5 V outputs (W4 and W5)

Figure 6 – Copper Foil Diagram.

7.6 Transformer Construction

Bobbin Set Up Orientation	Set up the bobbin with pin #1 oriented to the left-hand side.
Margin Tape	Apply 3.0 mm margin at each side of bobbin using item [7]. Match combined height of primary, shield and bias windings.
W1 Shield 1	Start with a floating lead temporary tie on pin 8. Wind 34 turns of item [3] from right to left. Wind tightly and uniformly across entire width of bobbin. Finish at pin 1 using item [6] at the finish leads. Remove the wire from pin 8 and cut the starting lead just at the starting of the winding.
Basic Insulation	Apply one layer of tape item [10].

LP_TOLERANCE			12	%	Primary inductance tolerance
NP			74		Primary Winding Number of Turns
ALG			150	nH/T^2	Gapped Core Effective Inductance
BM			2406	Gauss	Maximum Operating Flux Density at LP_TYP and ILIMITMAX, BM<3200 is recommended
BAC			641	Gauss	AC Flux Density for Core Loss Curves (0.5 X Peak to Peak)
ur			1444		Relative Permeability of Ungapped Core
LG			0.16	mm	Gap Length (Lg > 0.1 mm)
BWE			27.4	mm	Effective Bobbin Width
OD			0.37	mm	Maximum Primary Wire Diameter including insulation
INS			0.06	mm	Estimated Total Insulation Thickness (= 2 * film thickness)
DIA			0.31	mm	Bare conductor diameter
AWG			29	AWG	Primary Wire Gauge (Rounded to next smaller standard AWG value)
CM			128	Cmils	Bare conductor effective area in circular mils
CMA			404	Cmils/Amp	Primary Winding Current Capacity (200 < CMA < 500)
TRANSFORMER SECONDARY DESIGN PARAMETERS					
Lumped parameters					
ISP			11.41	Amps	Peak Secondary Current
ISRMS			6.03	Amps	Secondary RMS Current
IRIPPLE			5.44	Amps	Output Capacitor RMS Ripple Current
CMS			1206	Cmils	Secondary Bare Conductor minimum circular mils
AWGS			19	AWG	Secondary Wire Gauge (Rounded up to next larger standard AWG value)
VOLTAGE STRESS PARAMETERS					
VDRAIN			678	Volts	Maximum Drain Voltage Estimate (Assumes 20% zener clamp tolerance and an additional 10% temperature tolerance)
PIVS			20	Volts	Output Rectifier Maximum Peak Inverse Voltage

9 Performance Data

All measurements performed at room temperature, 60 Hz input frequency.

9.1 Efficiency

Figure 7 – Efficiency vs. Output Power, Room Temperature, 60 Hz.

9.1.1 Active Mode CEC Measurement Data

All single output adapters, including those provided with products, for sale in California after Jan 1st, 2007 must meet the California Energy Commission (CEC) requirement for minimum active mode efficiency and no load input power. Minimum active mode efficiency is defined as the average efficiency of 25, 50, 75 and 100% of rated output power with the limit based on the nameplate output power:

Nameplate Output (P_o)	Minimum Efficiency in Active Mode of Operation
< 1 W	$0.49 \times P_o$
≥ 1 W to ≤ 49 W	$0.09 \times \ln(P_o) + 0.5$ [ln = natural log]
> 49 W	0.84 W

For adapters that are single input voltage only, the measurement is made at the rated single nominal input voltage (115 VAC or 230 VAC); for universal input adapters the measurement is made at both nominal input voltages (115 VAC and 230 VAC).

To meet the standard, the measured average efficiency (or efficiencies for universal input supplies) must be greater than or equal to the efficiency specified by the CEC/Energy Star standard.

Percent of Full Load	Efficiency (%)	
	115 VAC	230 VAC
25	83.9	78.2
50	78.2	73.5
75	75.0	74.2
100	73.8	73.1
Average	77.7	74.8
CEC specified minimum average efficiency (%)	68.1	

More states within the USA and other countries are adopting this standard; for the latest up to date information please visit the PI Green Room:

11.4 Load Transient Response

In the figures shown below, signal averaging was used to better enable viewing the load transient response. Since the output switching and line frequency occur essentially at random with respect to the load transient, contributions to the output ripple from these sources will average out, leaving the contribution only from the load step response.

11.5 Output Ripple Measurements

11.5.1 Ripple Measurement Technique

For DC output ripple measurements, a modified oscilloscope test probe must be utilized in order to reduce spurious signals due to pickup. Details of the probe modification are provided in Figure 31 and Figure 32.

The 5125BA probe adapter is affixed with two capacitors tied in parallel across the probe tip. The capacitors include one (1) 0.1 $\mu\text{F}/50\text{ V}$ ceramic type and one (1) 1.0 $\mu\text{F}/50\text{ V}$ aluminum electrolytic. **The aluminum electrolytic type capacitor is polarized, so proper polarity across DC outputs must be maintained (see below).**

Figure 31 – Oscilloscope Probe Prepared for Ripple Measurement. (End Cap and Ground Lead Removed)

Figure 32 – Oscilloscope Probe with Probe Master 5125BA BNC Adapter. (Modified with wires for probe ground for ripple measurement, and two parallel decoupling capacitors added)

2 ms, 50 mV /div.

11.6 Line Surge

Differential input line 1.2/50 μ s surge testing was completed on a single test unit to IEC61000-4-5. Input voltage was set at 230 VAC / 60 Hz. Output was loaded at full load and operation was verified following each surge event.

Surge Level (V)	Input Voltage (VAC)	Injection Location	Injection Phase (°)	Test Result (Pass/Fail)
+500	230	L to N	90	Pass
-500	230	L to N	90	Pass
+1000	230	L to N	90	Pass
-1000	230	L to N	90	Pass
+2000	230	L to N	90	Pass
-2000	230	L to N	90	Pass
+2000	230	L,N to G	90	Pass
-2000	230	L,N to G	90	Pass

Unit passes under all test conditions.

12 Conducted EMI

Conducted EMI was tested at 115 VAC as well as 230 VAC. In both cases the output was grounded.

Figure 37 – Conducted EMI, Maximum Steady State Load, 115 VAC, 60 Hz, and EN55022 B Limits.

Figure 38 – Conducted EMI, Maximum Steady State Load, 230 VAC, 60 Hz, and EN55022 B Limits.

13 Appendix A

13.1 Output Power Delivery Using a TNY375PN

The table below compares the output power delivery of the TNY375PN vs. TNY376PN. No other modifications were made to the power supply. The measurements were taken at room temperature in open air. The input voltage was 85 VAC. The Continuous Power was measured when the source pin temperature stabilized at 71°C. This was the temperature that the TNY376 reached when delivering 7.5 Watts in the environment described above.

	TNY375PN	TNY376PN
Peak Power Capability (calculated)	11.4 W	13 W
Continuous Power Delivery (for 50 °C device temperature rise)	7.2 W	7.5 W
