

Low pass filter matched to STM32WL3xxx in high power mode, 16dBm, 413-479 MHz, 4-layers PCB

Chip scale package on glass 5 bumps

Features

- Integrated impedance matching to STM32WL3xxx
- 50 Ω nominal impedance on antenna side
- Deep rejection harmonic filter
- Low insertion loss
- Small footprint
- Low profile ≤ 630 µm after reflow
- High RF performances
- RF BOM and area reduction
- ECOPACK2 compliant component

Applications

STM32WL3 sub-GHz wireless microcontrollers

Description

The MLPF-WL-04D3 integrates an impedance matching network and harmonics filter. The matching impedance network has been tailored to maximize the RF performances of STM32WL3xxx. The MLPF-WL-04D3 uses STMicroelectronics IPD technology on non-conductive glass substrate, which optimizes RF performances.

2 Package information

To meet environmental requirements, ST offers these devices in different grades of ECOPACK packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions, and product status are available at: www.st.com. ECOPACK is an ST trademark.

SMD component

Table 8. RF transmission line characteristic impedances

RF transmission line	Value	Unit	Description
Antenna	50	Ω	Line between MLPF ANT pin and antenna
RX	45	Ω	Line between MLPF RX pin and STM32 RX pin
TX_HP	39	Ω	Line between MLPF TX pin and STM32 TX_HP pin

These transmission lines characteristic impedances have to be followed as closely as possible.

Moreover, lines physical dimensions have to be tuned according to a specific PCB stack up, if different from the one presented in the datasheet, to keep expected characteristic impedance values.

The ground plane on the top layer is mandatory in front of the MLPF, with shape and definition generating the best possible equipotentiality.

The vias and drills density needs to be maximized near the MLPF area to ensure optimal RF performances: at least 10 vias and drills between the L2 ground plane and the L1 ground plane below the IPD.

Land pattern at Layers 1 must be respected as described figure 5-b.

DS14798 - Rev 2 page 8/13

Layer	Name	Material	Thickness	Constant
	Top Overlay			
	Top Solder	Solder Resist	0.010mm	3.5
1	Top Layer	Copper	0.041mm	
	Dielectric 1	Core-028	0.254mm	4.4
2	Signal Layer 1	Copper	0.018mm	
	Dielectric 2	FR4	0.914mm	4.4
3	Signal Layer 2	Copper	0.018mm	
	Dielectric 3	Core-028	0.254mm	4.4
4	Bottom Layer	Copper	0.041mm	
	Bottom Solder	Solder Resist	0.010mm	3.5
	Bottom Overlay			

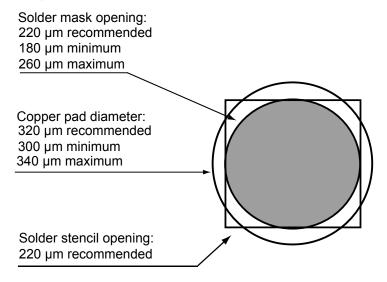

Figure 12. PCB stack-up recommendations

The PCB stack-up presented above is the one that was used to validate the product. The PCB dimensions should be as close as possible to the recommendations, particularly for the thickness of Dielectric 1.

The other dimensions can vary without having a major impact on the overall functioning of the product.

3.2 Stencil opening design

Figure 13. Footprint - 3 mils stencil - solder mask defined

3.3 Solder paste

- 1. Halide-free flux qualification ROL0 according to ANSI/J-STD-004.
- 2. "No clean" solder paste is recommended.
- 3. Offers a high tack force to resist component movement during high speed.
- 4. Use solder paste with fine particles: powder particle size 20-38 μm.

DS14798 - Rev 2 page 9/13

3.4 Placement

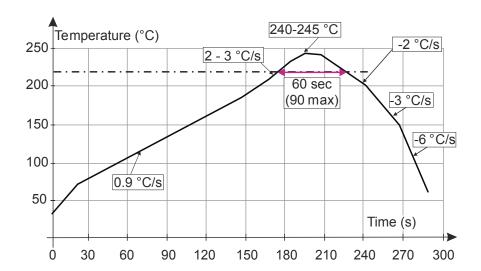

- 1. Manual positioning is not recommended.
- 2. It is recommended to use the lead recognition capabilities of the placement system, not the outline centering
- 3. Standard tolerance of ±0.05 mm is recommended.
- 4. 1.0 N placement force is recommended. Too much placement force can lead to squeezed out solder paste and cause solder joints to short. Too low placement force can lead to insufficient contact between package and solder paste that could cause open solder joints or badly centered packages.
- 5. To improve the package placement accuracy, a bottom side optical control should be performed with a high resolution tool.
- 6. For assembly, a perfect supporting of the PCB (all the more on flexible PCB) is recommended during solder paste printing, pick and place and reflow soldering by using optimized tools.

3.5 PCB design preference

- 1. To control the solder paste amount, the closed via is recommended instead of open vias.
- 2. The position of tracks and open vias in the solder area should be well balanced. A symmetrical layout is recommended, to avoid any tilt phenomena caused by asymmetrical solder paste due to solder flow away.

3.6 Reflow profile

Figure 14. ST ECOPACK recommended soldering reflow profile for PCB mounting

Note: Minimize air convection currents in the reflow oven to avoid component movement.

Note: More information is available in the application note:
